(54) Title: NOVEL INTERMEDIATES THE PREPARATION ANTIHISTAMINIC FOR DIPHENYLMETHYL/DIPHENYLMETHOXY PIPERIDINE DERIVATIVES

(57) Abstract

The present invention is related to novel intermediates and processes which are useful in the preparation of certain antihistaminic piperidine derivatives of formula (I) wherein W represents -C(=O)- or -CH(OH)-; R1 represents bydrogen or bydroxy; R2 represents hydrogen; R1 and R2 taken together form a second bond between the carbon atoms bearing R1 and R2; u is an integer of from 1 to 5; m is an integer 0 or 1; R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is

$$\begin{array}{c|c}

1 NOVEL INTERMEDIATES FOR THE PREPARATION OF ANTIHISTAMINIC 4-DIPHENYLMETHYL/DIPHENYLMETHOXY PIPERIDINE DERIVATIVES

BACKGROUND OF THE INVENTION

- This is a Continuation-In-Part Application of Patent Application Serial No.08/144,084, filed October 27, 1993 which is a Continuation-In-Part Application of Patent Application Serial No. 08/082,693, filed June 25, 1993.
- The present invention is related to novel intermediates which are useful in the preparation of certain piperidine derivatives which are useful as antihistamines, antiallergy agents and bronchodilators [United States Patent No. 4,254,129, March 3, 1981, United States Patent No. 4,254,130, March 3, 1981, United States Patent No. 4,285,958, April 25, 1981 and United States Patent No. 4,550,116, Oct. 29, 1985].

These antihistaminic piperidine derivatives can be 30 described by the following formula:

$$\begin{array}{c|c}
\hline
O \\
R_1 \\
\hline
(O)_m \\
R_2 \\
\hline
(CH_2)_n - W - O - CH_3 \\
\hline
A
\end{array}$$
(I)

wherein

W represents -C(=0)- or -CH(OH)-;

R₁ represents hydrogen or hydroxy;

R₂ represents hydrogen;

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

20 m is an integer 0 or 1;

R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and

pharmaceutically acceptable salts and individual

optical isomers thereof,

with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0.

30

SUMMARY OF THE INVENTION

The present invention provides novel intermediates useful for the preparation of certain antihistaminic piperidine derivatives of formula (I)

$$\begin{array}{c|c}
\hline
O & O \\
R_1 \\
CO)_m \\
R_2 \\
CH_3 \\
CH_3
\end{array}$$

$$\begin{array}{c}
CH_3 \\
CH_3
\end{array}$$

wherein

W represents -C(=0)- or -CH(OH)-;

R₁ represents hydrogen or hydroxy;

R2 represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

20 m is an integer 0 or 1;

R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual

25 optical isomers thereof,

with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0.

30

These novel intermediates are described by the following formulas:

A is a hydrogen or hydroxy; and

10 R₅ is H, -CH₂OD wherein D is hydrogen, acetate or benzoate, -CHO, Br, Cl, I, CN, -COOH, -COOalkyl or -CONR₆R₇ wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched and R₆ and R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R₆ and R₇ cannot both be represented by C₁-C₆alkoxy.

25 wherein

A is a hydrogen or hydroxy; and R₅ is H, Br, Cl, I, CN, -COOH, -COOalkyl

or $-\text{CONR}_6R_7$ wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched and R_6 and R_7 are each independently H, C_1-C_6 alkyl, C_1-C_6 alkoxy or R_6 and R_7 taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R_6 and R_7 cannot both be represented by C_1-C_6 alkoxy.

35

A is a hydrogen or hydroxy; and

10 R₅ is H, Br, Cl, I, CN, -COOH, -COOalkyl or
-CONR₆R₇ wherein the alkyl moiety has from 1 to 6
carbon atoms and is straight or branched and R₆ and
R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy
or R₆ and R₇ taken together with the nitrogen atom
form a pyrrolidine, piperidine or morpholine, with
the proviso that R₆ and R₇ cannot both be
represented by C₁-C₆alkoxy.

20 (V) Hal-
$$(CH_2)_n$$
 C CH_3 CH_3

wherein

35

25 Hal is Cl, Br or I;
n is an integer of from l to 5;
A is a hydrogen or hydroxy; and
R₅ is H, CH₂OD wherein D is hydrogen, acetate or
benzoate, CHO, Br, Cl, I, CN, -COOH or -CONR₆R₇
wherein R₆ and R₇ are each independently H, C₁C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with
the nitrogen atom form a pyrrolidine, piperidine or
morpholine, with the proviso that R₆ and R₇ cannot
both be represented by C₁-C₆alkoxy.

5 (VI) Hal-
$$(CH_2)_n$$
—C CH —Received:

15

10 Hal is Cl, Br or I;

n is an integer of from 1 to 5;

A is a hydrogen or hydroxy; and

Rs is H, Br, Cl, I, CN, -COOH, -COOalkyl or

-CONR₆R₇ wherein the alkyl moiety has from 1 to 6 carbonatoms and is straight or branched and R₆ and R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R₆ and R₇ cannot both be

20 represented by C₁-C₆alkoxy.

wherein

35

Hal is Cl, Br or I;

n is an integer of from 1 to 5;

30 A is a hydrogen or hydroxy;

R₅ is H, Br, Cl, I, CN, -COOH, -COOalkyl or

-CONR₆R₇ wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched and R₆ and R₇ are each independently H, C_1 - C_6 alkyl, C_1 - C_6 alkoxy or R₆ and R₇ taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R₆ and R₇ cannot both be represented by C_1 - C_6 alkoxy.

5 (VIII) Hal-
$$(CH_2)_n$$
— C — $C-CH_3$

10 Hal is Cl, Br or I;
 n is an integer of from 1 to 5; and
A is a hydrogen or hydroxy.

wherein A is a hydrogen or hydroxy.

20 (X) Hal-
$$(CH_2)_n$$
 CH CH_3 CH_3

wherein

Hal is Cl, Br or I; 25 n is an integer of from 1 to 5; A is a hydrogen or hydroxy; and R₅ is H, CH₂OD wherein D is hydrogen, acetate or benzoate, CHO, Br, Cl, I, CN, -COOH, -COOalkyl or -CONR₆R₇ wherein the alkyl moiety has from 1 to 6 30 carbon atoms and is straight or branched and $\ensuremath{R_6}$ and R7 are each independently H, C1-C6alkyl, C1-C6alkoxy or R6 and R7 taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R6 and R7 cannot both be 35 represented by C1-C6alkoxy; and individual optical isomers thereof.

25

30

(XI)

wherein

W represents -C(=O)- or -CH(OH)-;

15 R₁ represents hydrogen or hydroxy;

R2 represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

20 m is an integer 0 or 1;

R₅ is H, Br, Cl, I, CN or -CONR₆R₇ wherein R₆ and R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R₆ and R₇ cannot both be represented by C₁-C₆alkoxy;

A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0.

35 In addition, the present invention provides novel processes for preparing the antihistaminic piperidine derivatives of formula

 $\begin{array}{c|c}

\end{array}$ (1)

wherein

W represents -C(=0)- or -CH(OH)-;

15 R_1 represents hydrogen or hydroxy;

R₂ represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

20 m is an integer 0 or 1;

R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and

pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented

hydroxy, m is an integer 0, comprising the steps of:

(a) reacting a cumene compound of the formula

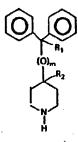

35

25

30

wherein A is as defined above with a ω -halo compound of the formula

- wherein B is halo or hydroxy, Hal represents Cl, Br or I and n is as defined above, in the presence of a suitable Lewis acid to produce a ω-halo cumylketone compound;
- (b) reacting the $\omega-halo$ cumylketone compound with a suitable halogenating agent to give a $\omega-halo-halo$ cumylketone compound;
- (c) reacting the ω-halo-halocumylketone compound compound with a suitable cyanating agent to give a ω-halocyanocumylketone compound;
- (d) reacting the ω-halo-cyanocumylketone compound with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'keto-α,α-dimethylphenylacetic acid imidate compound;
- (e) reacting the ω'-halo-α'-keto-α,αdimethylphenylacetic acid imidate compound with water to
 give a ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester
 compound;
- (f) reacting the $\omega'-halo-\alpha'-keto-\alpha,\alpha-$ dimethylphenylacetic acid ester compound with a piperidine compound of the formula

wherein R₁, R₂ and m are as defined above in the presence of a suitable non-nucleophilic base to produce a ω'-piperidineα'-keto-α,α-dimethylphenyl derivative of formula (I) wherein 5 R₃ is COOalkyl and W is -C(=O)-;

- (g) optionally hydrolyzing the ω'-piperidine- α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=0)- to produce a ω'-piperidine- α' 10 hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=0)-;
- (h) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is
 15 COOalkyl and W is -C(=O)- or the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-20 piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)-; and
- (i) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is 25 COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=O)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl
 30 derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative wherein R₃ is -COOalkyl and W is -C(=O)-; and
- (j) optionally reacting the ω'-piperidine-α'-keto-α,α-35 dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-

dimethylphenyl derivative of formula (I) wherein R₃ is -COOH
and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,αdimethylphenyl derivative of formula (I) wherein R₃ is 5 COOalkyl and W is -CH(OH)- with an appropriate deprotecting
reagent,

with the proviso that each of the hydroxy groups present in the compounds described in steps a-i are optionally 10 protected or unprotected.

In addition, the present invention provides novel processes for preparing the antihistaminic piperidine derivatives of formula

15

20

25

30

- W represents -C(=0)- or -CH(OH)-; R₁ represents hydrogen or hydroxy;
- R_2 represents hydrogen; or $R_1 \text{ and } R_2 \text{ taken together form a second bond between the carbon atoms bearing } R_1 \text{ and } R_2;$ n is an integer of from 1 to 5; m is an integer 0 or 1;
- 10 R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R₁ and R₂

 15 are taken together to form a second bond between the carbon atoms bearing R₁ and R₂ or where R₁ represented hydroxy, m is an integer 0, comprising the steps of:
- (a) reacting a ω-halo-halocumylketone compound with
 20 carbon dioxide under electrochemical reduction conditions to give a ω'-halo-α'-keto-α,α-dimethylphenylacetic compound;
- (b) reacting the ω'-halo-α'-keto-α,αdimethylphenylacetic compound compound with an appropriate 25 straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,αdimethylphenylacetic acid ester compound;
- (c) reacting the w'-halo-α'-keto-α,α30 dimethylphenylacetic acid ester compound with a piperidine compound of the formula wherein R₁, R₂ and m are as defined above in the presence of a suitable non-nucleophilic base to produce a w'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein
 35 R₃ is COOalkyl and W = -C(=O)-;
 - (d) optionally hydrolyzing the ω' -piperidine- α' -keto- α,α -dimethylphenyl derivative of formula (I) wherein R3 is

COOalkyl and W is -C(=0)- to produce a ω'-piperidine-α'keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=0)-;

- (e) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=O)- or the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)-; and
- (f) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)-or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-; and
 - (g) optionally reacting the ω' -piperidine- α' -keto- α , α -dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-, the ω' -piperidine- α' -keto- α , α -

dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=O)-, the ω'-piperidine-α'-hydroxy-α,αdimethylphenyl derivative of formula (I) wherein R₃ is -COOH
and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,αdimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -CH(OH)- with an appropriate deprotecting
reagent,

10 with the proviso that each of the hydroxy groups present in the compounds described in steps a-f are optionally protected or unprotected.

In addition, the present invention provides novel
15 processes for preparing the antihistaminic piperidine
derivatives of formula

25

30

W represents -C(=0) or -CH(OH)-;

R₁ represents hydrogen or hydroxy;

- 5 R₂ represents hydrogen; or
 - R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer 3;

m is an integer 0 or 1;

- 10 R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R₁ and R₂ are taken together to form a second bond between the carbon atoms bearing R₁ and R₂ or where R₁ represented hydroxy, m is an integer 0, comprising the steps of:
 - (a) reacting a cumyl compound of the formula

20

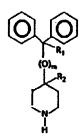

25 wherein A is as defined above with an appropriate cyclopropyl compound of the structure

30

wherein B is halo or hydroxy, in the presence of a suitable Lewis acid to produce a cyclopropyl cumylketone compound;

35 (b) reacting the cyclopropyl cumylketone compound with a suitable halogenating agent to give a cyclopropyl halocumylketone compound;

- (c) reacting the cyclopropyl halocumylketone compound with carbon dioxide under electrochemical reduction conditions to give a cyclopropylketo-α,α 5 dimethylphenylacetic acid compound;
- (d) reacting the cyclopropylketo-α,α-dimethylphenylacetic with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound;
- (e) reacting the ω '-halo- α '-keto- α , α -dimethylphenylacetic acid ester compound with a piperidine 15 compound of the formula

- wherein R_1 , R_2 and m are as defined above in the presence of a suitable non-nucleophilic base to produce a w'-piperidine- α '-keto- α , α -dimethylphenyl derivative of formula (I) wherein R_3 is COOalkyl and W = -C(=0)-;
- (f) optionally hydrolyzing the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=0)- to produce a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=0)-;
- (g) optionally reacting the ω' -piperidine- α' -keto- α,α -dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=0)- or the ω' -piperidine- α' -keto- α,α -dimethylphenyl derivative of formula (I) wherein R₃ is COOH

and W is -C(=0)- with a suitable reducing agent to produce a
w'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of
formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of
formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)-; and

- (h) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -10 COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=O)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl
 15 derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)-or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)-; and
- (i) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,

with the proviso that each of the hydroxy groups present in the compounds described in steps a-h are optionally protected or unprotected.

35 Another embodiment of the present invention involves a process for preparing the piperidine derivatives of formula

isomers thereof, with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0, comprising the steps of:

30 (a) reacting a α,α-dimethylphenylacetic acid amide compound of the formula

35

wherein A is as defined above and R_6 and R_7 are each independently H, C_1 - C_6 alkyl, C_1 - C_6 alkoxy or R_6 and R_7 taken

together with the nitrogen atom for a pyrrolidine, piperidine or morpholine, with the proviso that R_6 and R_7 cannot both be represented by C_1 - C_6 alkoxy with a ω -halo 5 compound of the formula

- wherein B is halo or hydroxy, Hal represents Cl, Br or I and n is as defined above, in the presence of a suitable Lewis acid to produce a ω'-halo-α'-keto-α,α-dimethylphenylacetic acid amide compound;
- (b) reacting the ω' -halo- α' -keto- α , α -dimethylphenylacetic acid amide compound with a piperidine compound of the formula

- wherein R₁ and R₂ are as defined above in the presence of a suitable non-nucleophilic base to produce a w'-piperidinea'-keto-a,a-dimethylphenyl derivative of formula (XI)
- wherein R_5 is -CONR₆R₇ wherein R_6 and R_7 are as defined 30 above;
- (c) optionally hydrolyzing the w'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (XI) wherein R₅ is -CONR₆R₇ wherein R₆ and R₇ are as defined above to produce a w'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=0)-;

- (d) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)-; and
- (e) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -10 COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl
 15 derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-; and
- (f) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,
 - with the proviso that each of the hydroxy groups present in the compounds described in steps a-e are optionally protected or unprotected.
- 35 Another embodiment of the present invention involves a process for preparing the piperidine derivatives of formula

wherein

W represents -C(=O)- or -CH(OH)-;

15 R₁ represents hydrogen or hydroxy;

R2 represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

20 m is an integer 0 or 1;

 R_3 is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0, comprising the steps of:

(a) reacting a toluene compound of the formula

35

25

30

wherein A is as defined above with a ω -halo compound of the formula

- wherein B is halo or hydroxy, Hal represents Cl, Br or I and n is as defined above, in the presence of a suitable Lewis acid to produce a ω-halo-tolylketone compound;
- (b) reacting the ω-halo-tolylketone compound with a suitable base to give a cyclopropyl-tolylketone compound;
 - (c) reacting the cyclopropyl-tolylketone compound with a suitable halogenating agent to give a cyclopropylhalotolylketone compound;
 - (d) reacting the cyclopropyl-halotolylketone compound with a suitable cyanating agent to give a cyclopropyl cyanotolylketone compound;
- (e) reacting the cyclopropyl cyanotolylketone compound with a suitable methylating agent to give a cyclopropyl cyanocumylketone compound;
- (f) reacting the cyclopropyl cyanocumylketone compound with a suitable base to give a cyclopropylketo-α,α-dimethylphenylacetic acid amide;
- (g) reacting the cyclopropylketo-α,αdimethylphenylacetic acid amide with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound;
- (h) reacting the $\omega'\text{-halo-}\alpha'\text{-keto-}\alpha,\alpha\text{-}$ dimethylphenylacetic acid ester compound with a piperidine compound of the formula

wherein R₁, R₂ and m are as defined above in the presence of a suitable non-nucleophilic base to produce a ω'-piperidineα'-keto-α,α-dimethylphenyl derivative;

- (i) optionally hydrolyzing the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative to produce a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)-;
- (j) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=0)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)-; and
- (k) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (II) wherein R₃ is -COOalkyl and W is -C(=0)-; and
 - (1) optionally reacting the ω' -piperidine- α' -keto- α , α -dimethylphenyl derivative of formula (II) wherein R₃ is -

COOH and W is -C(=0)-, the w'-piperidine-a'-keto-a,a-dimethylphenyl derivative of formula (II) wherein R₃ is -COOalkyl and W is -C(=0)-, the w'-piperidine-a'-hydroxy-a,a-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the w'-piperidine-a'-hydroxy-a,a-dimethylphenyl of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,

10 with the proviso that each of the hydroxy groups present in the compounds described in steps a-k are optionally protected or unprotected.

Another embodiment of the present invention involves a 15 process for preparing the piperidine derivatives of formula

20

30

25

W represents -C(=O)- or -CH(OH)-;

R1 represents hydrogen or hydroxy;

- 5 R₂ represents hydrogen; or
 - R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

m is an integer 0 or 1;

- 10 R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R₁ and R₂ are taken together to form a second bond between the carbon atoms bearing R₁ and R₂ or where R₁ represented hydroxy, m is an integer 0, comprising the steps of:
- (a) reacting a phenylacetic acid ester compound of the 20 formula

25

wherein A is as defined above with a ω -halo compound of the formula

30

wherein B is halo or hydroxy, Hal represents Cl, Br or I and n is as defined above, in the presence of a suitable Lewis acid to produce a ω' -halo- α' -keto-phenylacetic acid ester compound;

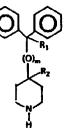

35

(b) reacting the ω' -halo- α' -keto-phenylacetic acid ester compound with a suitable methylating agent in the

presence of a suitable base to give a cyclopropylketo- α , α -dimethylphenylacetic acid ester;

- (c) purifying the cyclopropylketo-α,αdimethylphenylacetic acid ester by distillation and/or recrystallization;
- (d) reacting the cyclopropylketo-α,α10 dimethylphenylacetic acid ester with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound;
- 15 (e) reacting the ω '-halo- α '-keto- α , α -dimethylphenylacetic acid ester compound with a piperidine compound of the formula

20

25

30

wherein R_1 , R_2 and m are as defined above in the presence of a suitable non-nucleophilic base to produce a ω '-piperidine- α '-keto- α , α -dimethylphenyl derivative of formula (I) wherein R_3 is -COOalkyl and W is -C(=O)-;

- (f) optionally hydrolyzing the ω' -piperidine- α' -keto- α,α -dimethylphenyl derivative of formula (I) wherein R_3 is -COOalkyl and W is -C(=O)- to produce a ω' -piperidine- α' -keto- α,α -dimethylphenyl derivative of formula (I) wherein R_3 is COOH and W is -C(=O)-;
- (g) optionally reacting the ω' -piperidine- α' -keto- α , α -dimethylphenyl derivative of formula (I) wherein R_3 is COOH

and W is -C(=0)- with a suitable reducing agent to produce a ω '-piperidine- α '-hydroxy- α , α -dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)-; and

5

- (h) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃
 10 is -COOH and W is -C(=0)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl
 15 derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-; and
- (i) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH
 20 and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,

with the proviso that each of the hydroxy groups present in the compounds described in steps a-h are optionally 30 protected or unprotected.

(g) optionally reacting the ω'-piperidine-α'-keto-α,α-35 dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)-; and

- (h) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -5 COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl
 10 derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-; and
- (i) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,
- 25 with the proviso that each of the hydroxy groups present in the compounds described in steps a-h are optionally protected or unprotected.

As used herein, the term "C1-C6alkyl" or "alkyl" refers

30 to a straight or branched alkyl group having from 1 to 6
carbon atoms and as referred to herein are methyl, ethyl, npropyl, isopropyl, n-butyl, sec-butyl, tert-butyl, n-pentyl,
neopentyl and n-hexyl. The term "C1-C6alkoxy" refers to a
straight or branched alkoxy group having from 1 to 6 carbon

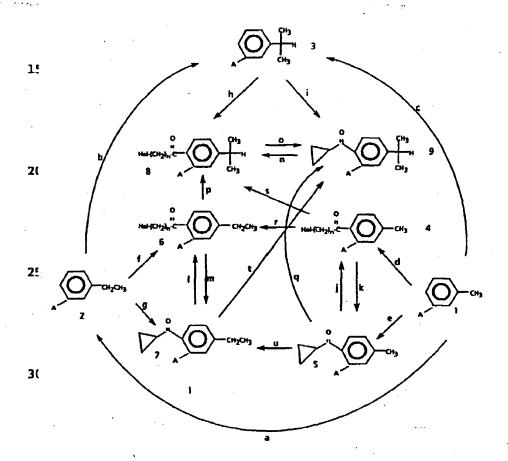

35 atoms and as referred to herein are methoxy, ethoxy, npropoxy, isopropoxy, n-butoxy, sec-butoxy, tert-butoxy, npentoxy, neopentoxy and n-hexoxy. The term "Hal" or "halo"
refers to a halogen group and includes C1, Br or I.

The piperidine derivatives of the formula (IX) can form pharmaceutically acceptable salts. Pharmaceutically 5 acceptable acid addition salts of the compounds of this invention are those of any suitable inorganic or organic acid. Suitable inorganic acids are, for example, hydrochloric, hydrobromic, sulfuric, and phosphoric acids. Suitable organic acids include carboxylic acids, such as, 10 acetic, propionic, glycolic, lactic, pyruvic, malonic, succinic, fumaric, malic, tartaric, citric, cyclamic, ascorbic, maleic, hydroxymaleic, and dihydroxymaleic, benzoic, phenylacetic, 4-aminobenzoic, 4-hydroxybenzoic, anthranillic, cinnamic, salicyclic, 4-aminosalicyclic, 2-15 phenoxybenzoic, 2-acetoxybenzoic, and mandelic acid, sulfonic acids, such as, methanesulfonic, ethanesulfonic and β-hydroxyethanesulfonic acid. Non-toxic salts of the compounds of the above-identified formula formed with inorganic or organic bases are also included within the 20 scope of this invention and include, for example, those of alkali metals, such as, sodium, potassium and lithium, alkaline earth metals, for example, calcium and magnesium, light metals of group IIIA, for example, aluminum, organic amines, such as, primary, secondary or tertiary amines, for 25 example, cyclohexylamine, ethylamine, pyridine, methylaminoethanol and piperazine. The salts are prepared by conventional means as, for example, by treating a piperidine derivative of formula (I) with an appropriate acid or base.

The novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is hydrogen may be prepared as described in 5 Scheme A. In Scheme A, all substituents are as previously defined unless otherwise indicated.

Scheme A

1(

35

Scheme A provides various general synthetic procedures for preparing the novel intermediates of formula (II), formula (III) and formula (IV) wherein R_5 is hydrogen.

In step a, the appropriate toluene derivative of structure (1) is methylated to give the corresponding ethylbenzene derivative of structure (2).

For example, the appropriate toluene derivative of structure (1) is reacted with a slight molar excess of an appropriate methylating agent, such as iodomethane,

10 chloromethane or bromomethane in the presence of a suitable non-nucleophilic base, such as potassium t-butoxide or sodium hydride. The reaction is typically conducted in a suitable organic solvent, such as diglyme, tert-butyl methyl ether or methylene chloride, for a period of time

15 ranging from 30 minutes to 24 hours and at a temperature range of from -78°C to room temperature. The corresponding ethylbenzene derivative of structure (2) is recovered from the reaction zone by extractive methods as is known in the art and may be purified by distillation.

20

In step b, the appropriate ethylbenzene derivative of structure (2) is methylated to give the corresponding cumene derivative of structure (3) as described previously in step a, but using at least 2 molar equivalents of methylating agent.

In step c, the appropriate toluene derivative of structure (1) is dimethylated to give the corresponding cumeme derivative of structure (3) as described previously in step a but using at least 2 molar equivalents of methylating agent.

In step d, the appropriate toluene derivative of structure (1) is acylated with an appropriate ω -halo compound of the structure $\operatorname{Hal-(CH_2)_n-C(=O)-B}$, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding ω -halo tolylketone compound of structure (4).

For example, the appropriate ω-halo tolylketone compound of structure (4) may be prepared by reacting an 5 appropriate toluene derivative of structure (1) with an appropriate w-halo compound of the structure Hal-(CH2)n-C(=0)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined, which are known in the art or are prepared by procedures well known in the art, under 10 the general conditions of a Friedel-Crafts acylation using a suitable Lewis acid. The reaction is carried out in a solvent, such as carbon disulfide, 1,2-dichloroethane, nhexane, acetonitrile, 1-nitropropane, nitromethane, diethyl ether and carbon tetrachloride, methylene chloride, 15 tetrachloroethane or nitrobenzene with methylene chloride being the preferred solvent. The reaction time varies from about 1/2 hour to 25 hours, preferably 10 to 16 hours and the reaction temperature varies from about 0°C to 25°C. The corresponding w-halo tolylketone compound of structure 20 (4) is recovered from the reaction zone by an aqueous quench followed by extraction as is known in the art. The ω-halo tolylketone compound of structure (4) may be purified by procedures well known in the art, such as crystallization and/or distillation.

25

Alternatively, the appropriate toluene derivative of structure (1) may be acylated with the w-halo compound of the structure Hal-(CH₂)_n-C(=0)-B, wherein B is hydroxy, Hal is Cl, Br or I and n is as previously defined in the presence of a Lewis acid to give the corresponding w-halo tolylketone compound of structure (4) as described in Arch. Pharm. 306, 807 1973. In general, an appropriate toluene derivative of structure (1) and the w-halo compound of the structure Hal-(CH₂)_n-C(=0)-B, wherein B is hydroxy, are melted together at about 50°C, then cooled to about 10°C after which a Lewis acid is added in an amount about 2.2 times the molar amount of the appropriate toluene derivative of structure (1) employed. The mixture is

heated at about 70°C for about 2 hours after which a 30% sodium acetate solution is added and extracted with ether. The organic layer is dried and the solvent evaporated to give the corresponding w-halo tolylketone compound of structure (4). The w-halo tolylketone compound of structure (4) may be purified by procedures well known in the art, such as crystallization and/or distillation.

Suitable Lewis acids for the acylation reaction described in step d are well known and appreciated in the art. Examples of suitable Lewis acids are boron trichloride, aluminum chloride, titanium tetrachloride, boron trifluoride, tin tetrachloride, ferric chloride, cobalt(II) chloride and zinc chloride, with aluminum chloride being preferred. The selection and utilization of suitable Lewis acids for the acylation reaction of step d is well known and appreciated by one of ordinary skill in the art.

20

The starting ω -halo compound of the structure Hal-(CH₂)_n-C(=0)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined are commercially available of easily prepared by generally known methods.

25

While also not necessary for utilization in the acylation reaction of step d, the phenol functionality of those toluene derivatives of structure (1), wherein A is hydroxy may be protected with a suitable protecting group.

30 For example, suitable protecting groups for the phenolic hydroxy include methyl ether, 2-methoxyethoxymethyl ether (MEM), cyclohexyl ether, o-nitrobenzyl ether, 9-anthryl ether, t-butyldimethylsilyl ether, acetate, benzoate, methyl carbamate, benzyl carbamate, aryl pivaloate and aryl methanesulfonate.

In step e, to appropriate toluene derivative of

structure (1) is acylated with an appropriate cyclopropyl compound of the structure

5

wherein B is as previously defined to give the corresponding cyclopropyl tolylketone derivative of structure (5) as described previously in step d.

In step f, the appropriate ethylbenzene derivative of structure (2) is acylated with an appropriate ω -halo compound of the structure $\operatorname{Hal-(CH_2)_n-C(=0)-B}$, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding ω -halo ethylphenylketone compound of structure (6) as described previously in step d.

20

15

In step g, the appropriate ethylbenzene derivative of structure (2) is acylated with an appropriate cyclopropyl compound of the structure

25

30 ·

wherein B is as previously defined to give the corresponding cyclopropyl ethylphenylketone derivative of structure (7) as described previously in step e.

5

In step h, the appropriate cumene derivative of structure (3) is acylated with an appropriate w-halo compound of the structure Hal-(CH₂)_n-C(=O)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding w-halo cumylketone compound of structure (8) as described previously in step d.

In step i, to appropriate cumene derivative of 15 structure (3) is acylated with an appropriate cyclopropyl compound of the structure

20

wherein B is as previously defined to give the corresponding cyclopropyl cumylketone derivative of structure (9) as described previously in step e.

25

In step j, the cyclopropyl functionality of the appropriate cyclopropyl tolylketone derivative of structure (5) is ring-opened to give the corresponding ω -halo tolylketone compound of structure (4) wherein n=3.

30

For example, the appropriate cyclopropyl tolylketone derivative of structure (5) is reacted with an appropriate hydrogen halide in a suitable organic solvent, such as toluene, xylene and ethanol. The reaction is typically conducted at a temperature range of from room temperature to 70°C and for a period of time ranging from 20 minutes to 10 hours. The corresponding ω -halo tolylketone compound of structure (4) wherein n = 3 is isolated from the reaction

zone by evaporation of the solvent or may be stored in a solution of the hydrogen halide.

In step k, the appropriate ω -halo tolylketone compound of structure (4) wherein n = 3 is ring-closed to give the corresponding cyclopropyl tolylketone derivative of structure (5).

For example, the appropriate ω-halo tolylketone compound of structure (4) wherein n = 3 is reacted with an appropriate non-nucleophilic base, such as sodium hydroxide or potassium hydroxide in a suitable organic protic solvent, such as methanol or ethanol. The reaction is typically conducted at a temperature range of from -10°C to room temperature and for a period of time ranging from 10 minutes to 5 hours. The corresponding cyclopropyl tolylketone derivative of structure (5) is isolated from the reaction zone by extractive methods as are known in the art and may be purified by distillation.

In step 1, the cyclopropyl functionality of the appropriate cyclopropyl ethylphenylketone derivative of structure (7) is ring-opened to give the corresponding w
25 halo ethylphenylketone compound of structure (6) wherein n

= 3 as described previously in step j.

In step m, the appropriate w-halo ethylphenylketone compound of structure (6) wherein n = 3 is ring-closed to give the corresponding cyclopropyl ethylphenylketone derivative of structure (7) as described previously in step k.

In step n, the cyclopropyl functionality of the

35 appropriate cyclopropyl cumylketone derivative of structure

(9) is ring-opened to give the corresponding ω-halo

cumylketone compound of structure (8) wherein n = 3 as

described previously in step j.

In step o, the appropriate w-halo cumylketone compound of structure (8) wherein n = 3 is ring-closed to give the corresponding cyclopropyl cumylketone derivative of structure (9) as described previously in step k.

In step p, the appropriate ω -halo ethylphenylketone compound of structure (6) is methylated to give the corresponding ω -halo cumylketone compound of structure (8) as described previously in step a.

In step q, the appropriate cyclopropyl tolylketone derivative of structure (5) is dimethylated to give the corresponding cyclopropyl cumylketone derivative of structure (9) as described previously in step c.

In step r, the appropriate w-halo tolylketone compound of structure (4) is methylated to give the corresponding w20 halo ethylphenylketone compound of structure (6) as described previously in step a.

In step s, the appropriate w-halo tolylketone compound of structure (4) is dimethylated to give the corresponding w-halo cumylketone compound of structure (8) as described previously in step c.

In step t, the appropriate cyclopropyl ethylphenylketone derivative of structure (7) is methylated 30 to give the corresponding cyclopropyl cumylketone derivative of structure (9) as described previously in step a.

In step u, the appropriate cyclopropyl tolylketone
35 derivative of structure (5) is methylated to give the
corresponding cyclopropyl ethylphenylketone derivative of
structure (7) as described previously in step a.

Starting materials for use in Scheme A are readily available to one of ordinary skill in the art.

The following examples present typical syntheses as described in Scheme A. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "µL" refers to microliters; "µg" refers to micrograms; and "uM" refers to micromolar.

15

Example 1

Step h: 4-Chloro-1-(4-isopropyl-phenyl)-butan-1-one Slurry aluminum chloride (140.9g, 1.075mol) and 4chlorobutyryl chloride (148g, 1.05mol) in methylene 20 chloride (1.0L) add, by dropwise addition, cumene (125g, 1.04mol) over a thirty minute period under a nitrogen atmosphere while maintaining the internal temperature between 5-8°C with an ice bath. Allow the stirred solution to come to room temperature and continue stirring under 25 nitrogen for 14 hours. Cautiously add the methylene chloride solution to IL of crushed ice with stirring and add additional methylene chloride (400mL). Separate the organic phase and wash with 10% hydrochloric acid (3X300mL), water (3X300mL), 10% sodium bicarbonate 30 (3X300mL) and water (3X300mL). Dry (MgSO₄), filter and wash with methylene chloride (150mL). Evaporate the solvent to give the title compound (203g, 86%) as a clear oil which crystallizes on standing; mp 35-37°C.

35 ¹H NMR (300MHz, CDCl₃) δ 7.91 (d, J=8.2Hz, 2H), 7.31 (d, J=8.2Hz, 2H), 3.65 (t, J=6.3Hz, 2H), 3.13 (t, J=6.9Hz, 2H), 2.95 (p, J=6.9Hz, 1H), 2.20 (p, J=6.6Hz, 2H), 1.26 (d, J=6.9Hz, 6H); ¹³C NMR (75MHz, CDCl₃) δ198.2, 154.4, 134.4,

128.1, 126.5, 44.5, 32.96, 34.0, 26.7, 23.5; IR (CDCl₃)
2950, 2920, 1675, 1680, 1600, 1410, 1225 cm⁻¹; MS (GCCIMS (methane)) 255 (3), 251 (10), 227 (30 (M+H)), 225 (100
5 (M+H)), 189 (70), 147 (95), 107 (13, 105 (40).

Anal. Calcd for $C_{13}H_{17}OC1$: C, 69.48; H, 7.62; Found: C, 69.31; H, 7.39.

10 Example 2

Step d: 4-Chloro-1-(4-methyl-phenyl)-butan-1-one
Suspend anhydrous AlCl3 (156g, 1.15mol) in toluene (1500mL)
and cool to 2-4°C. Add, by slow addition, a solution of 4chlorobutyryl chloride (165.5g, 1.15mol) in toluene

- 15 (300mL). Stir for 15 minutes and pour into stirring icewater (2.5L). Stir for 30 hours, decant the toluene and extract the aqueous phase with toluene (700mL). Combine the organic layers and wash three times with water (1L, 1L, 500mL). Evaporate the solvent in vacuo to give the title
- 20 compound as a pale yellow oil (292.3g, 95%).

Example 3

Step k: Cyclopropyl-p-tolyl-methanone

Dissolve potassium hydroxide (126g) in methanol (450mL),

25 stir and cool in an ice-water bath. Add, by dropwise
addition, a solution of 4-chloro-1-(4-methyl-phenyl)-butan1-one (292g) in methanol (450mL). Stir for 20 minutes at
8-10°C and partially evaporate the methanol in vacuo to
give 400mL of a residue. Pour the residue, with stirring,

30 into water (1500mL), filter the white solid and dry under
vacuum to give the title compound as a white solid (190.8g,
90%).

The following compounds can be prepared using the 35 methodology depicted in Scheme A:

Cyclopropyl-(4-isopropyl-phenyl)-methanone;

Cyclopropyl-(4-ethyl-phenyl)-methanone; and

4-Chloro-1-(4-ethyl-phenyl)-butan-1-one.

The novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is OH, Cl. Br or I may be prepared as described in Scheme B. In Scheme B, all substituents are as previously defined unless otherwise indicated.

Scheme B

Hal = Cl, Br or l

35

Scheme B provides various general synthetic procedures for preparing the novel intermediates of formula (II),

formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R_5 is OH, Cl, Br or I.

In step a, the appropriate ω-halo cumylketone compound of structure (8) is halogenated to give the corresponding ω-halo-halocumylketone compound of structure (10).

For example, the appropriate w-halo-halocumylketone 10 compound of structure (10) may be prepared by reacting an appropriate ω-halo cumylketone compound of structure (8) with a suitable halogenating agent optionally in the presence of a catalytic amount of a suitable initiator. Examples of suitable brominating agents are N-15 bromosuccinimide, and 1,3-dibromo-5,5-dimethyl hydantoin, with N-bromosuccinimide being preferred. An example of suitable chlorinating agent is N-chlorosuccinimide and an example of a suitable iodinating agent is N-iodosuccinimide. Examples of suitable initiators are benzoyl peroxide, AIBN, 20 t-butyl peroxide and ultraviolet light. The reaction is carried out in a solvent, such as carbon tetrachloride, methylene chloride, 1,2-dichlorobenzene, 1,2dichloroethane, ethyl formate or ethyl acetate, with carbon tetrachloride being the preferred solvent. The reaction 25 time varies from about 1/2 hour to 8 hours, preferably 1/2 to 2 hours and the reaction temperature varies from about 25°C to the reflux temperature of the solvent employed, preferably 70°C to 80°C. The corresponding ω-halohalocumylketone compound of structure (10) is recovered 30 from the reaction zone by extractive methods as are known in the art followed by evaporation of the solvent.

In addition, the halogenation reaction of step a may be carried out in a 2-phase procedure. For example, the appropriate w-halo-halocumylketone compound of structure (10) may be prepared by reacting an appropriate w-halo cumylketone compound of structure (8) with a suitable halogenating agent, such as sodium bromate/sodium bromide,

in a solvent mixture such as methylene chloride and water, catalyzing the reaction with, for example, ultraviolet light. The corresponding ω-halo-halocumylketone compound of structure (10) is recovered from the reaction zone by extractive methods as are known in the art followed by evaporation of the solvent.

The w-halo-halocumylketone compound of structure (10) 10 may dehydrohalogenate to the corresponding α-methylstyrene, giving various mixtures of w-halo-halocumylketone compound of structure (10) and α-methylstyrene compounds. The αmethylstyrene compounds in such a mixture may be backconverted to w-halo-halocumylketone compound of structure 15 (10) by treatment with anhydrous hydrogen halide gas. Typically, a solution of the mixture of w-halohalocumylketone compound of structure (10) and amethylstyrene compounds in a suitable organic solvent, such as methylene chloride or acetonitrile, is treated with a 20 suitable anhydrous hydrogen halide gas, such as hydrogen chloride. The reaction is typically treated with the hydrogen halide gas for a period of time ranging from 30 minutes to 5 hours and at a temperature range of from 0°C to room temperature. The remediated ω-halo-halocumylketone 25 compound of structure (10) may be isolated by evaporation of solvent, but may be stored as a solution in the organic solvent containing hydrogen halide gas.

In addition, halogen exchange of the benzylic halogen 30 can be accomplished by thorough solvolysis in the presence of the appropriate hydrogen halide.

For example, the ω-chloro-halocumylketone compound of structure (10) can be prepared from the ω-bromo35 halocumylketone compound of structure (10) by thorough aqueous solvolysis in the presence of hydrogen chloride.

In step b, the appropriate cyclopropyl cumylketone derivative of structure (9) is halogenated to give the corresponding cyclopropyl halocumylketone compound of structure (11) as described previously in step a.

In step c, the cyclopropyl functionality of the appropriate cyclopropyl halocumylketone compound of structure (11) is ring-opened to give the corresponding w-10 halo-halocumylketone compound of structure (10) wherein n = 3 as described previously in Scheme A, step j.

In step d, the appropriate w-halo ethylphenylketone compound of structure (6) is halogenated to give the corresponding w-halo-haloethylphenylketone compound of structure (12) as described previously in step a.

In step e, the appropriate w-halo tolylketone compound of structure (4) is halogenated to give the corresponding w-halo halotolylketone compound of structure (13) as described previously in step a.

In step f, the appropriate cyclopropyl ethylphenylketone derivative of structure (7) is halogenated to give the corresponding cyclopropyl haloethylphenylketone compound of structure (14) as described previously in step a.

In step g, the appropriate cyclopropyl tolylketone

derivative of structure (5) is halogenated to give the
corresponding cyclopropyl halotolylketone of structure (15)
as described previously in step a.

In step h, the appropriate cyclopropyl halotolylketone

of structure (15) is ring-opened to give the corresponding

w-halo halotolylketone compound of structure (13) wherein n

= 3 as described previously in Scheme A, step j.

15

In step i, the appropriate cyclopropyl haloethylphenylketone compound of structure (14) is ring-opened to give the corresponding w-halo5 haloethylphenylketone compound of structure (12) wherein n

In addition, the novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and 10 formula (VII) wherein R₅ is OH may be prepared by solvolysis of the corresponding novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is Cl, Br or I, with, for example, tetrahydrofuran and water or any slightly acidic medium.

Starting materials for use in Scheme B are readily available to one of ordinary skill in the art.

= 3 as described previously in Scheme A, step j.

The following examples present typical syntheses as

20 described in Scheme B. These examples are understood to be
illustrative only and are not intended to limit the scope
of the present invention in any way. As used herein, the
following terms have the indicated meanings: "g" refers to
grams; "mmol" refers to millimoles; "mL" refers to

25 milliliters; "bp" refers to boiling point; "°C" refers to
degrees Celsius; "mm Hg" refers to millimeters of mercury;
"µL" refers to microliters; "µg" refers to micrograms; and
"µM" refers to micromolar.

30 Example 4

1-[4-(1-Bromo-1-methyl-ethyl)-phenyl]-4-chloro-butan-1-one

Step a, Method A:

Dissolve 4-chloro-l-(4-isopropyl-phenyl)-butan-l-one (2.10g, 9.35mmol) in carbontetrachloride (30mL), add N-bromosuccinimide (1.75g, 9.83mmol) and benzoylperoxide (3mg) and stir at reflux for 1 hour. Cool the reaction mixture, filter, wash with water and brine. Dry (MgSO₄), filter and

evaporate the solvent *invacuo* to give the title compound as an amber oil.

5 Step a, Method B:

Dissolve 4-chloro-1-(4-isopropyl-phenyl)-butan-1-one
(5.00g, 22.2mmol) and N-bromosuccinimide (4.1g, 23.0mmol)
in carbon tetrachloride (25mL) and add AIBN radical
initiator (300mg). Stir and maintain under a nitrogen
10 atmosphere at 80-90°C or optionally irradiate with a
sunlamp until a vigorous exotherm occurs at which point
momentarily remove until reflux subsides and then reapply
the heat. Reflux for 30 minutes and add another potion of
N-bromosuccinimide (100mg) while maintaining reflux and
15 reflux an additional 15 minutes. Cool to room temperature
and precipitate the succinimide from the solution by
allowing to stand overnight. Filter and wash the
succinimide (2.25g) with carbon tetrachloride (20mL).
Combine the filtrates and evaporate the solvent in vacuo to

¹H NMR (300MHz, CDCl₃) δ 7.935 (d, J=8.4Hz, 2H), 7.70 (d, J=8.4Hz, 2H), 3.66 (t, J=6.3Hz, 2H), 3.16 (t, J=6.8Hz, 2H), 2.21 (p, J=6.8Hz, 2H), 2.19 (s, 6H); ¹³C NMR (75MHz, CDCl₃) δ 198.1 (151.63), 135.8, 128.0, 126.0, 62.3, 44.5, 35.3, 35.1, 26.7; IR (neat) 2970, 2910, 1680, 1675, 1600, 1402,

20 give the title compound as a yellow oil (6.80g, 100%).

Step a, Method C:

1225, 1180 cm-1.

Dissolve 4-chloro-l-(4-isopropyl-phenyl)-butan-l-one (74.7g, 333mmol) in methylene chloride (250mL) and add sodium bromate (17.6g, 117mmol) in water (75mL) in a three-necked Morton flask equipped with an overhead stirrer. Cool the solution to 10°C and irradiate with two 150W incandescent flood lamps. Add, by dropwise addition, a solution of sodium bromide (24g, 233mmol) and stir for 2 hours. Illuminate for another 30 minutes, add sodium dithionate (2.0g), separate the organic phase, dry (MgSO4)

and evaporate the solvent *invacuo* to give the title compound (100g, 99%).

5 Step a, Method D:

Dissolve 1-[4-(1-bromo-1-methyl-ethyl)-phenyl]-4-chloro-butan-1-one (10.4g assayed at 67% by weight and containing 18wt% 1-[4-(2-propene)-phenyl]-4-chloro-butan-1-one) in methylene chloride (50mL) and sparge hydrogen chloride through the solution for 70 minutes. Evaporate the solvent invacuo to give a 3:1 mixture of 1-[4-(1-bromo-1-methyl-ethyl)-phenyl]-4-chloro-butan-1-one and 1-[4-(1-chloro-1-methyl-ethyl)-phenyl]-4-chloro-butan-1-one (11.6g).

15

Example 5

(4-Bromomethyl-phenyl)-cyclopropyl-methanone

Step g: Dissolve 4-chloro-l-(4-isopropyl-phenyl)-butan-lone (20g, 124mmol) and 2,2'-Azolons (2-methylpropionitrile)

20 (0.5g) in methylene chloride (100mL) and cool to 5°C. Add
a suspension of N-bromosuccinimide (12g) in methylene
chloride (50mL) and irradiate with light (150 Watt lamp),
maintaining the temperature at 5°C. After 2, 3 and 7 hour
time periods, add additional N-bromosuccinimide (6g, 6g,
25 2.8g) and continue stirring. After 7.5 hours, wash with
water (200mL) and with 0.4M sodium hydrogen carbonate
(2X200mL). Dry (Na₂SO₄), evaporate the solvent invacuo and
recrystallize (hexane) to give the title compound as a
crystalline solid (26.7g).

30

The following compounds can be prepared by procedures depicted in Scheme B:

[4-(1-bromoethyl)-phenyl]-cyclopropyl-methanone;

35

[4-(1-bromo-1-methyl-ethyl)-phenyl]-cyclopropyl-methanone;

1-[4-(1-bromomethyl)-phenyl]-4-chloro-butan-1-one; and

1-[4-(1-bromoethyl)-phenyl]-4-chloro-butan-1-one.

The novel intermediates of formula (VIII) and (IX) and the novel intermediates of formula (II), formula (III), formula (IV), formula (VV) and formula (VII) wherein R₅ is Cl, Br or I may also be prepared as described in Scheme C. In Scheme C, all substituents are as previously defined unless otherwise indicated.

Scheme C

35

Scheme C provides various general synthetic procedures for preparing the the novel intermediates of formula (VIII) and (IX) and novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is Cl, Br or I.

In step a, the appropriate α-methylstyrene compound of structure (16) is acylated with an appropriate ω-halo compound of the structure Hal-(CH₂)_n-C(=O)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding ω-halo-α-methylstyrene compound of structure (17) as described previously in Scheme A, step d.

15

In step b, the appropriate α -methylstyrene compound of structure (16) is acylated with an appropriate cyclopropyl compound of the structure

20

wherein B is as previously defined to give the

corresponding cyclopropyl a-methylstyreneketone derivative

of structure (18) as described previously in Scheme A, step

e.

In step c, the appropriate ω -halo- α -methylstyrene compound of structure (17) wherein n = 3 is ring-closed to give the corresponding cyclopropyl α -methylstyreneketone derivative of structure (18) as described previously in Scheme A, step k.

In step d, the appropriate cyclopropyl α methylstyreneketone derivative of structure (18) is ringopened to give the corresponding ω -halo- α -methylstyrene

compound of structure (17) wherein n = 3 as described previously in Scheme A, step j.

- In step e, the appropriate ω -halo- α -methylstyrene compound of structure (17) is hydrohalogenated to give the corresponding ω -halo-halocumylketone derivative of structure (10).
- For example, the appropriate ω-halo-α-methylstyrene compound of structure (17) is treated with anhydrous hydrogen halide at a temperature range of from -50°C to room temperature, preferably 0°C -5°C and for a period of time ranging from 5 minutes to 2 hours. The ω-halo-halocumylketone derivative of structure (10) is recovered from the reaction zone by purging with nitrogen.

In step f, the appropriate ω -halo-halocumylketone derivative of structure (10) is dehydrohalogenated to give the corresponding ω -halo- α -methylstyrene compound of structure (17) by treatment with base as is known in the art.

In step g, the appropriate cyclopropyl a
25 methylstyreneketone derivative of structure (18) is
hydrohalogenated to give the corresponding cyclopropyl
halocumylketone comound of structure (11) as described
previously in step e.

In step h, the appropriate cyclopropyl halocumylketone comound of structure (11) is dehydrohalogenated to give the corresponding cyclopropyl a-methylstyreneketone derivative of structure (18) as described previously in step f.

The novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is CN may be prepared as described in Scheme D.

5 In Scheme D, all substituents are as previously defined unless otherwise indicated.

Scheme D Cont.

formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is CN.

In step a, the appropriate ω -halo-halocumylketone compound of structure (10) is cyanated to give the corresponding ω -halo-cyanocumylketone compound of structure (19).

For example, the appropriate ω-halo-cyanocumylketone compound of structure (19) may be prepared by reacting an appropriate ω-halo-halocumylketone compound of structure (10) with a suitable cyanating agent. Examples of suitable cyanating agents are trimethylsilyl cyanide, diethylaluminum cyanide and tetrabutylammonium cyanide, with trimethylsilyl cyanide being preferred. The reaction is carried out in a solvent, such as methylene chloride, tetrachloroethane and carbon tetrachloride, with methylene chloride being the preferred solvent. A catalytic amount of a suitable Lewis acid may also be employed in the reaction.

Examples of suitable Lewis acids are boron trichloride, aluminum chloride, titanium tetrachloride, boron trifluoride, tin tetrachloride and zinc chloride, with tin tetrachloride being preferred. The reaction time varies from about 1/2 hour to 8 hours, preferably 1/2 to 2 hours and the reaction temperature varies from about 0°C to room temperature, preferably room temperature. The w-halo-cyanocumylketone compound of structure (16) is recovered from the reaction zone by an aqueous quench followed by extraction as is known in the art. The w-halo-cyanocumylketone compound of structure (16) may be purified by procedures well known in the art, such as chromatography and crystallization.

15

In step b, the appropriate ω -halo cumylketone compound of structure (8) is cyanated to give the corresponding ω -halo-cyanocumylketone compound of structure (19).

Por example, the ω-halo-cyanocumylketone compound of structure (19) may be prepared by reacting an appropriate the ω-halo cumylketone compound of structure (8) with a suitable cyanating agent. Examples of suitable cyanating agent are cyanogen chloride, cyanogen bromide and cyanogen iodide, with cyanogen chloride being preferred. The reaction is carried out according to the procedures outlined by Tanner and Bunce, <u>J. Am. Chem. Soc.</u>, 91, 3028 (1969).

In step c, the appropriate cyclopropyl halocumylketone compound of structure (11) is cyanated to give the corresponding cyclopropyl cyanocumylketone compound of structure (20) as described previously in step a.

In step d, the appropriate cyclopropyl cumylketone derivative of structure (9) is cyanated to give the corresponding cyclopropyl cyanocumylketone compound of structure (20) as described previously in step b.

In step e, the appropriate w-halo-haloethylphenylketone compound of structure (12) is cyanated to give the corresponding w-halo-cyanoethylphenylketone compound of structure (21) as described previously in step a.

In step f, the appropriate ω-halo-ethylphenylketone compound of structure (6) is cyanated to give the
 corresponding ω-halo-cyanoethylphenylketone compound of structure (21) as described previously in step b.

In step g, the appropriate ω-halo halotolylketone
compound of structure (13) is cyanated to give the

15 corresponding ω-halo cyanotolylketone compound of structure
(22) as described previously in step a.

In step h, the appropriate ω -halo tolylketone compound of structure (4) is cyanated to give the corresponding ω 20 halo cyanotolylketone compound of structure (22) as described previously in step b.

In step i, the appropriate cyclopropyl ethylphenylketone compound of structure (7) is cyanated to give the corresponding cyclopropyl cyanoethylphenylketone compound of structure (23) as described previously in step b.

In step j, the appropriate cyclopropyl

30 haloethylphenylketone compound of structure (14) is
cyanated to give the corresponding cyclopropyl
cyanoethylphenylketone compound of structure (23) as
described previously in step a.

In step k, the appropriate cyclopropyl tolylketone compound of structure (5) is cyanated to give the corresponding cyclopropyl cyanotolylketone compound of structure (24) as described previously in step b.

In step 1, the appropriate cyclopropyl halotolylketone of structure (15) is cyanated to give the corresponding cyclopropyl cyanotolylketone compound of structure (24) as described previously in step a.

Starting materials for use in Scheme D are readily available to one of ordinary skill in the art.

10

The following examples present typical syntheses as described in Scheme D. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the 15 following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "µL" refers to microliters; "µg" refers to micrograms; and "µM" refers to micromolar.

Example 6

Step a: 2-[4-(4-chloro-butyryl)-phenyl]-2-methylpropionitirile

- Dissolve 1-[4-(1-bromo-1-methyl-ethyl)-phenyl]-4-chloro-butan-1-one (2.00g, 6.59mmol) in anhydrous methylene chloride (20mL) and place under an argon atmosphere. Add trimethylsilyl cyanide (1.10mL, 8.25mmol) followed by tin (IV) chloride (0.20mL, 1.7mmol) via syringe. Stir at reflux 30 for 1 hour, add water (20mL) and stir for an additional 1/2 hour. Separate the layers and extract the aqueous layer with methylene chloride. Combine the organic layers, wash with brine, dry (MgSO₄), filter and evaporate the solvent in vacuo. Purify by silica gel chromatography (15% ethyl 35 acetate/hexane) to give the title compound as a white solid; mp 79-80°C.
 - Example 7

Step 1: (4-Cyclopropanecarbonyl-phenyl)-acetonitrile
Mix (4-bromomethyl-phenyl)-cyclopropyl-methanone (5.0g,
21mmol), potassium cyanide (2.0g, 30mmol), tetra5 butylammonium bromide (150mg), water (5mL) and acetonitrile
(50mL). Mechanically stir at room temperature for 3 hours,
pour into water (450mL) and stir overnight. Collect by
filtration and recrystallize (hexane) to give the title
compound as a white crystalline solid; mp 86-87°C.

10

The following compounds can be prepared by the synthetic procedures depicted in Scheme D:

15 2-(4-Cyclopropanecarbonyl-phenyl)-propionitrile;

2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl-propionitrile;

[4-(4-Chloro-butyryl)-phenyl]-acetonitrile; and

20

2-[4-(4-Chloro-butyryl)-phenyl]-propionitrile.

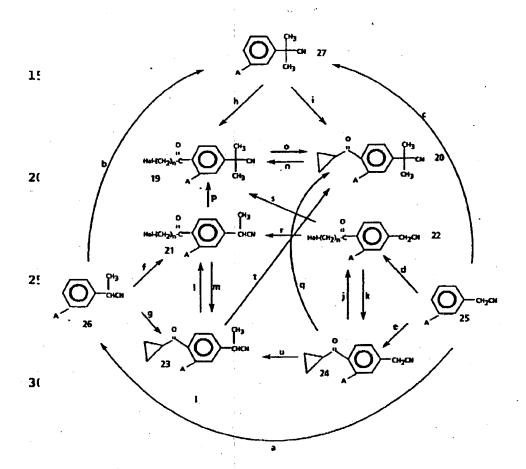

25

30

The novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R_5 is CN may also be prepared as described in Scheme E. In Scheme E, all substituents are as previously defined unless otherwise indicated.

Scheme E

10 .

35

Scheme E provides alternative various general synthetic procedures for preparing the novel intermediates of formula

- (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R_5 is CN.
- In step a, the appropriate phenylacetonitrile compound of structure (25) is methylated to give the corresponding 2-cyanoethylbenzene compound of structure (26) as described previously in Scheme A, step a.
- Appropriate phenylacetonitrile compounds of structure
 (25) may be prepared from the corresponding benzyl halide
 by techniques and procedures well known by one of ordinary
 skill in the art and described previously in Scheme D, step

15

- Appropriate benzyl halide compounds may be prepared from the corresponding toluene derivative of structure (1) as described previously in Scheme B, step a.
- In step b, the appropriate 2-cyanoethylbenzene compound of structure (26) is methylated to give the corresponding 2-cyano-2-propylbenzene compound of structure (27) as described previously in Scheme A, step a.
- Appropriate 2-cyanoethylbenzene compound of structure (26) may be prepared from the corresponding α -methylbenzyl halide by techniques and procedures well known by one of ordinary skill in the art and as described previously in step a.

- Appropriate α -methylbenzyl halide compounds may be prepared from the corresponding ethylbenzene derivative of structure (2) as described previously in Scheme B, step a.
- In step c, the appropriate phenylacetonitrile compound of structure (25) is dimethylated to give the corresponding 2-cyano-2-propylbenzene compound of structure (27) as described previously in Scheme A, step c.

In step d, the appropriate phenylacetonitrile compound of structure (25) is acylated with an appropriate ω -halo compound of the structure $\mathrm{Hal}-(\mathrm{CH_2})_n$ - $\mathrm{C}(=\mathrm{O})$ - B , wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding ω -halo cyanotolylketone compound of structure (22) as described previously in Scheme A, step d.

10

In step e, the appropriate phenylacetonitrile compound of structure (25) is acylated with an appropriate cyclopropyl compound of the structure

15

wherein B is as previously defined to give the
corresponding cyclopropyl cyanotolylketone compound of
structure (24) as described previously in Scheme A, step e.

In step f, the appropriate 2-cyanoethylbenzene compound of structure (26) is acylated with an appropriate ω -halo compound of the structure Hal-(CH₂)_n-C(=O)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding ω -halo-cyanoethylphenylketone compound of structure (21) as described previously in Scheme A, step d.

30

In step g, the appropriate 2-cyanoethylbenzene compound of structure (26) is acylated with an appropriate cyclopropyl compound of the structure

wherein B is as previously defined to give the corresponding cyclopropyl cyanoethylphenylketone compound of structure (23) as described previously in Scheme A, step 5 e.

In step h, the appropriate 2-cyano-2-propylbenzene compound of structure (27) is acylated with an appropriate w-halo compound of the structure Hal-(CH₂)_n-C(=O)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding w-halo-cyanocumylketone compound of structure (19) as described previously in Scheme A, step d.

15 Appropriate 2-cyano-2-propylbenzene compound of structure (27) may be prepared from the corresponding α,α-dimethylbenzyl halide by techniques and procedures well known by one of ordinary skill in the art and as described previously in step a.

20

Appropriate α, α -dimethylbenzyl halide compounds may be prepared from the corresponding cumene derivative of structure (3) as described previously in Scheme B, step a.

In step i, the appropriate 2-cyano-2-propylbenzene compound of structure (27) is acylated with an appropriate cyclopropyl compound of the structure

30

wherein B is as previously defined to give the corresponding cyclopropyl cyanocumylketone compound of structure (20) as described previously in Scheme A, step e.

In step j, the cyclopropyl functionality of the appropriate cyclopropyl cyanotolylketone compound of

structure (24) is ring-opened to give the corresponding ω -halo cyanotolylketone compound of structure (22) wherein n = 3 as described previously in Scheme A, step j.

5

In step k, the appropriate ω-halo cyanotolylketone
compound of structure (22) wherein n = 3 is ring-closed to
give the corresponding cyclopropyl cyanotolylketone
compound of structure (24) as described previously in
10 Scheme A, step k.

In step 1, the cyclopropyl functionality of the appropriate cyclopropyl cyanoethylphenylketone compound of structure (23) is ring-opened to give the corresponding ω15 halo-cyanoethylphenylketone compound of structure (21) wherein n = 3 as described previously in Scheme A, step j.

In step m, the appropriate w-halocyanoethylphenylketone compound of structure (21) wherein n
20 = 3 is ring-closed to give the corresponding cyclopropyl
cyanoethylphenylketone compound of structure (23) as
described previously in Scheme A, step k.

In step n, the cyclopropyl functionality of the

25 appropriate cyclopropyl cyanocumylketone compound of

structure (20) is ring-opened to give the corresponding ω
halo-cyanocumylketone compound of structure (19) wherein n

= 3 as described previously in Scheme A, step j.

30 In step o, the appropriate ω-halo-cyanocumylketone compound of structure (19) is ring-closed to give the corresponding cyclopropyl cyanocumylketone compound of structure (20) as described previously in Scheme A, step k.

In step p, the appropriate ω-halocyanoethylphenylketone compound of structure (21) is methylated to give the corresponding ω-halocyanocumylketone compound of structure (19) as described previously in Scheme A, step a.

- In step q, the appropriate cyclopropyl cyanotolylketone compound of structure (24) is dimethylated to give the corresponding cyclopropyl cyanocumylketone compound of structure (20) as described previously in Scheme A, step c.
- In step r, the appropriate ω-halo cyanotolylketone compound of structure (22) is methylated to give the corresponding ω-halo-cyanoethylphenylketone compound of structure (21) as described previously in Scheme A, step a.
- In step s, the appropriate ω-halo cyanotolylketone compound of structure (22) is dimethylated to give the corresponding ω-halo-cyanocumylketone compound of structure (19) as described previously in Scheme A, step c.
- 20 In step t, the appropriate cyclopropyl cyanoethylphenylketone compound of structure (23) is methylated to give the corresponding cyclopropyl cyanocumylketone compound of structure (20) as described previously in Scheme A, step a.

25

30

In step u, the appropriate cyclopropyl cyanotolylketone compound of structure (24) is methylated to give the corresponding cyclopropyl cyanoethylphenylketone compound of structure (23) as described previously in Scheme A, step a.

Starting materials for use in Scheme E are readily available to one of ordinary skill in the art.

35 The following examples present typical syntheses as described in Scheme E. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the

following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "µL" refers to microliters; "µg" refers to micrograms; and "µM" refers to micromolar.

Example 7

10 Step c: Cumyl cyanide

Place phenylacetonitrile (92.3mL, 0.800mol), tetra n-butylammonium chloride (4.45g of a 50% solution, 8.0mmol) and 50% aqueous sodium hydroxide solution (2.874 mole NaOH) into a 3-neck round-bottom flask, with a thermowell,

overheard stirrer, reflux condenser with a dry-ice/acetone trap and a sparge tube. Heat to 40-70C with stirring at 115 RPM (paddle stir blade), and bubble in methyl chloride gas (11.7g, 0.232 mole) over a 30 minute period. Turn off the methly chloride addition and heat and stir overnight.

20

Sparge additional methyl chloride (35.4g, 0.700 mol) into the reaction mixture (heated to 35C) over a period of 2 hours. Stir the resulting mixture at ambient temperature for 22 hours and sparge additional methyl chloride (39.5g, 0.78lmol) into the reaction mixture at a temperature of 40-70C (mostly at 55-60C). Sparge additional methyl chloride (8.7g, 0.172mol) into the reaction mixture and allow to cool to 30C. Remove the condenser and add deionized water (250mL) and heptane (250mL). Transfer to a separatory funnel and draw off the aqueous (bottom) layer. Wash the remining organic layer with fresh water (2X100mL), evaporate the solvent in vacuo to give a dark red oil.

Add the oil, 50% aqueous sodium hydroxide (79g, 0.988 mole)

35 and tetra n-butylammonium chloride (1.0g, 3.6mmol) to a

500mL 3-necked round bottom flask with a magnetic stir bar.

Using the same experimental procedure described above,

sparge in methyl chloride. Heat to 40-60C, stir and sparge
in methyl chloride (20.5g, 0.40 mole) over 1 hour. Allow

the reaction mixture to cool, add deionized water (100g) and stir. Allow the layers to settle and remove the bottom layer by pipet. Repeat wash with additional water (100g) to give the title compound as a dark orange oil (111.0g, wet with water).

Example 8

Step q: 2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl10 propionitrile

Dissolve potassium t-butoxide (2.42g, 21.6mmol) in diglyme (8mL), cool to 10°C and slowly add with mechanical stirring, a solution of (4-cyclopropanecarbonyl-phenyl)-acetonitrile (2g, 10.8mmol) and methyl iodide (1.5mL,

- 15 24.0mmol) in diglyme (10mL). After 10 minutes, add additional potassium t-butoxide (0.3g, 2.6mmol) in diglyme (2mL) and stir for a total of 45 minutes. Pour into a mixture of water (100mL) and ethyl acetate (50mL) and adjust the pH to 1.5-2 with dilute hydrochloric acid.
- 20 Separate the organic phase and extract the aqueous phase with ethyl acetate (50mL). Combine the organic phases and wash with brine (2X100mL). Dry (Na₂SO₄), evaporate the solvent *in vacuo* and recrystallize (ethyl ether/hexane) to give the title compound as a yellow solid; mp 80-82°C.

25

The following compounds can be prepared by procedures depicted in Scheme E:

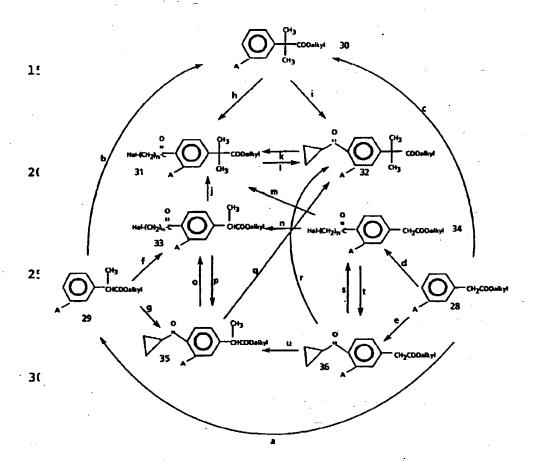

(4-Cyclopropanecarbonyl-phenyl)-acetonitrile;

- 2-[4-(4-chloro-butyryl)-phenyl]-2-methyl-propionitirile;
- 2-(4-Cyclopropanecarbonyl-phenyl)-propionitrile;
- 35 [4-(4-Chloro-butyryl)-phenyl]-acetonitrile; and
 - 2-[4-(4-Chloro-butyryl)-phenyl]-propionitrile.

The novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is COOalkyl may also be prepared as described in Scheme F. In Scheme F, all substituents are as previously defined unless otherwise indicated.

Scheme F

1(

Scheme F provides alternative various general synthetic procedures for preparing the novel intermediates of formula (II), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is COOalkyl.

In step a, the appropriate phenylacetic acid ester compound of structure (28) is methylated to give the corresponding α-methylphenylacetic acid ester compound of structure (29) as described previously in Scheme A, step a.

Appropriate phenylacetic acid ester compounds of structure (28) are prepared from the corresponding phenylacetic acid compounds by standard esterification reactions which are well known by one of ordinary skill in the art.

Appropriate phenylacetic acid compounds may be prepared by hydrolysis of the corresponding phenylacetonitrile

compounds of structure (25) by techniques and procedures well known and appreciated by one of ordinary skill in the art, such as base hydrolysis. Alternatively, the phenylacetic acid compounds may be prepared by electrochemical carboxylation of the corresponding benzyl halide as described in Scheme H, step h.

In step b, the appropriate α-methylphenylacetic acid ester compound of structure (29) is methylated to give the corresponding α,α-dimethylphenylacetic acid ester compound of structure (30) as described previously in Scheme A, step a.

Alternatively α-methylphenylacetic acid ester compound of structure (29) are prepared for the corresponding α-35 methylphenylacetic acid compounds by standard esterification reactions which are well known by one of ordinary skill in the art as described in step a.

Appropriate α-methylphenylacetic acid compounds may be prepared by hydrolysis of the corresponding 2-cyanoethylbenzene compound of structure (26) as described previously in step a. Alternatively, the α-methylphenylacetic acid compounds may be prepared by electrochemical carboxylation of the corresponding α-methylbenzyl halide as described in Scheme H, step h.

In step c, the appropriate phenylacetic acid ester compound of structure (28) is dimethylated to give the corresponding α,α-dimethylphenylacetic acid ester compound of structure (30) as described previously in Scheme A, step c.

15

Alternatively α, α -dimethylphenylacetic acid ester compound of structure (30) are prepared for the corresponding α, α -dimethylphenylacetic acid compounds by standard esterification reactions which are well known by one of ordinary skill in the art as described in step a.

Appropriate α,α-dimethylphenylacetic acid compounds may be prepared by hydrolysis of the corresponding 2-cyano-2-propylbenzene compound of structure (27) as described previously in step a. Alternatively, the α,α-dimethylphenylacetic acid compounds may be prepared by electrochemical carboxylation of the corresponding α,α-dimethylbenzyl halide as described in Scheme H, step h. Appropriate α,α-dimethylbenzyl halide compounds may be prepared by hydrohalogenation of the corresponding α-methylstyrene as described previously in Scheme C, step e.

In step d, the appropriate phenylacetic acid ester compound of structure (28) is acylated with an appropriate w-halo compound of the structure Hal-(CH₂)_n-C(=0)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding w'-halo-a'-

keto-phenylacetic acid ester compound of structure (34) as described previously in Scheme A, step d.

In step e, the appropriate phenylacetic acid ester compound of structure (28) is acylated with an appropriate cyclopropyl compound of the structure

10

wherein B is as previously defined to give the corresponding cyclopropylketo-phenylacetic acid ester compound of structure (33) as described previously in Scheme A, step e.

In step f, the appropriate α -methylphenylacetic acid ester compound of structure (26) is acylated with an appropriate ω -halo compound of the structure Hal-(CH₂)_n-C(=0)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding ω '-halo- α '-keto- α -methylphenylacetic acid ester compound of structure (30) as described previously in Scheme A, step d.

25

In step g, the appropriate α -methylphenylacetic acid ester compound of structure (29) is acylated with an appropriate cyclopropyl compound of the structure

30

wherein B is as previously defined to give the corresponding cyclopropylketo- α -methylphenylacetic acid ester compound of structure (35) as described previously in Scheme A, step e.

51

In step h, the appropriate α,α-dimethylphenylacetic
acid ester compound of structure (30) is acylated with an
appropriate ω-halo compound of the structure Hal-(CH₂)_n5 C(=0)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I
and n is as previously defined to give the corresponding
ω'-halo-α'-keto-α,α-di-methylphenylacetic acid ester
compound of structure (31) as described previously in
Scheme A, step d.

10

Appropriate α,α-dimethylphenylacetic acid ester compound of structure (30) are prepared for the corresponding α,α-dimethylphenylacetic acid compounds by standard esterification reactions which are well known by one of ordinary skill in the art as described in step a.

Appropriate α,α -dimethylphenylacetic acid compounds may be prepared by hydrolysis of the corresponding 2-cyano-2-propylbenzene compound of structure (27) as described previously in step a.

In step i, the appropriate α,α -dimethylphenylacetic acid ester compound of structure (30) is acylated with an appropriate cyclopropyl compound of the structure

25

- wherein B is as previously defined to give the corresponding cyclopropylketo-α,α-dimethylphenylacetic acid ester compound of structure (32) as described previously in Scheme A, step e.
- In step j, the appropriate ω' -halo- α' -keto- α methylphenylacetic acid ester compound of structure (33) is
 methylated to give the corresponding ω' -halo- α' -keto- α , α -

di-methylphenylacetic acid ester compound of structure (32) as described previously in Scheme A, step a.

In step k, the cyclopropyl functionality of the appropriate cyclopropylketo-α,α-dimethylphenylacetic acid ester compound of structure (32) is ring-opened to give the corresponding ω'-halo-α'-keto-α,α-di-methylphenylacetic acid ester compound of structure (31) wherein n = 3 as described previously in Scheme A, step j.

In step 1, the appropriate w'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound of structure (31)
wherein n = 3 is ring-closed to give the corresponding
cyclopropylketo-α,α-dimethylphenylacetic acid ester
compound of structure (32) as described previously in
Scheme A, step k.

In step m, the appropriate ω'-halo-α'-keto-phenylacetic 20 acid ester compound of structure (34) is dimethylated to give the corresponding ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound of structure (31) as described previously in Scheme A, step c.

In step n, the appropriate ω '-halo- α '-keto-phenylacetic acid ester compound of structure (34) is methylated to give the corresponding ω '-halo- α '-keto- α -methylphenylacetic acid ester compound of structure (33) as described previously in Scheme A, step a.

30

In step o, the cyclopropyl functionality of the appropriate cyclopropylketo- α -methylphenylacetic acid ester compound of structure (35) is ring-opened to give the corresponding ω' -halo- α' -keto- α -methylphenylacetic acid ester compound of structure (33) wherein n=3 as described previously in Scheme A, step j.

In step p, the appropriate w'-halo-α'-keto-αmethylphenylacetic acid ester compound of structure (33)
wherein n = 3 is ring-closed to give the corresponding
cyclopropylketo-α-methylphenylacetic acid ester compound of
structure (35) as described previously in Scheme A, step k.

In step q, the appropriate cyclopropylketo-αmethylphenylacetic acid ester compound of structure (35) is
10 methylated to give the corresponding cyclopropylketo-α,αdimethylphenylacetic acid ester compound of structure (32)
as described previously in Scheme A, step a.

In step r, the appropriate cyclopropylketo-phenylacetic acid ester compound of structure (36) is dimethylated to give the corresponding cyclopropylketo-a,a-dimethylphenylacetic acid ester compound of structure (32) as described previously in Scheme A, step c.

In step s, the cyclopropyl functionality of the appropriate cyclopropylketo-phenylacetic acid ester compound of structure (36) is ring-opened to give the corresponding ω'-halo-α'-keto-phenylacetic acid ester compound of structure (34) wherein n = 3 as described previously in Scheme A, step j.

In step t, the appropriate ω' -halo- α' -keto-phenylacetic acid ester compound of structure (34) wherein n=3 as is ring-closed to give the corresponding cyclopropylketo-phenylacetic acid ester compound of structure (36) as described previously in Scheme A, step k.

In step u, the appropriate cyclopropylketo-phenylacetic acid ester compound of structure (36) is methylated to give the corresponding cyclopropylketo-a-methylphenylacetic acid ester compound of structure (35) as described previously in Scheme A, step a.

Starting materials for use in Scheme F are readily available to one of ordinary skill in the art.

The following examples present typical syntheses as described in Scheme F. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "µL" refers to microliters; "µg" refers to micrograms; and "uM" refers to micromolar.

15

Example 9

Step c: 2-Methyl-2-phenylpropionate, methyl ester Equip a two liter, 3-necked, round bottom flask with a thermowell with a thermometer, heating mantle, mechanical 20 agitator, gas inlet for MeCl, rubber septum for sampling by syringe and a cryoscopic condensing system. The condensing system is composed of an 18 inch inner helical coil/outer jacket condenser chilled to -50C with refrigerated acetone topped with a dry ice cold finger having approximately 100 25 square inches of chilled surface area. The cold finder is vented through a drying tube filled with drying agent and MeCl is supplied from a lecture bottle mounted on a digital balance. The feed rate can be accurately controlled using a needle valve and monitored by rotomter. The rotometer is 30 calibrated with MeCl to give an average response of 2.5mg/min/scale division. Phenylacetic acid, ethyl ester is supplied via 1/16 inch stainless steel tubing inserted through the rubber sampling septum by a HPLC pump from a 1 liter bottle mounted on a digital balance. The bottle is 35 sealed with a septum and vented through a drying tube filled with drying agent. The temperature is controlled using a thermowatch to regulate the heating mantle. If cooling is required, it is accomplished either by immersing

```
the reaction flask in a water bath or simply by removing the mannie.

Allow to agitate at ambient to 50C and resume the reaction to 50C and Meri the reaction and for 45 minutes. Beat the reaction and for 45 minutes. Beat the reaction to 50C and Meri temperature overnight. She addition of morny another to 50C and resume temperature overnight.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             continue nearing for 1.3 nours. Resume the addition to agitate at ambient to for 45 minutes.

Tun for 45 minutes.

Tun for 45 minutes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       temperature overnight. Beat the reaction to 50c and resume (0.4ml/min) and Mecling (0.4ml/min) and methyl phenylacetate (0.4ml/min) and methylacetate 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the addition of methyl phenylacetate (0.4mL/min) and Meclyl when a total of 2469 of methyl when a total of and anitate (approximately has been added and the addition and anitate of the addition of methyl phenylacetate of the addition of methyl phenylacetate (0.4mL/min) and Mecl 2469 of methyl phenylacetate (0.4mL/min) and methyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (approximately 0.27g/min). When a total of 2469 of methyl when a total of addition and agitate the addition and agitate added, stop the addition and agitate phenylacitate has been added.
```

overnight. Distill the glyme at 1 atm. until the pot temperature reaches 125C. Cool the residue and pour into water (1L) containing acetic acid (100mL). Filter through filter aid and separate the phases. Distill the organic phase through a 10-plate Oldershaw column fitted with a reflux splitting head at 4mm Hg. Collect 10mL at a 5:2 reflux ratio and discard. Collect the title compound at a 2:1 reflux ratio and head temperature of 93C (100g).

10

Example 10

Step d: [4-(4-Chloro-butyryl)-phenyl]-acetic acid, ethyl ester and [3-(4-Chloro-butyryl)-phenyl]-acetic acid, ethyl ester

- 15 Method A: Load a 3-neck flask with sublimed AlCl₃ (293g, 2.08mmol) and heptane (400mL). Cool to below 5°C and slowly add chlorobutyryl chloride (125mL), keeping the temperature below 5°C. Add phenylethyl acetate (160mL), keeping the temperature below 10°C and stir overnight.
- Decant the heptane layer and dissolve the residue in methylene chloride (400mL). Slowly pour the methylene chloride solution into a mixture of concentrated hydrochloric acid (200mL) and cracked ice. Separate the organic phase, wash with water (1L), followed by 5% sodium hydrogen carbonate (1L). Evaporate the solvent in vacuo to give a red oil (243g).

Dissolve the red oil (243g) in methylene chloride (250mL) and sparge with hydrogen chloride gas for 1.5 hours and evaporate the solvent *in vacuo* to give the title compound as a 50:50 mixture of para and meta isomers (243g).

Method B: Place aluminum chloride (293g) and methylene chloride (300mL) in a lL, 3-neck round bottom flask with a thermowell and equipped with a thermomter, mechanical stirrer, reflux condenser, equilibrating dropping funnel and ice bath. Cool to 10C and add, by dropwise addition, 4-chlorobutyryl chloride (169g), keeping the temperature

below 10C. After addition is complete, add, by dropwise addition, phenylethyl acetate (164g), keeping the temperature below 10C. Heat the reaction to 40C for 16 5 hours, slowly pour into a mechanically agistated 4L beaker containing ice/water (2000g) and stir for 1 hour: Separate the layers, extract the water phase with methylene chloride (50mL), filter the combined organic phases through a 1/4 inch thick bed of filter aid and extract eequentially with 10 water (100mL) and 10 wt% Na2CO3 (200mL). Re-extract the cargbonate solution with fresh methylene chloride (50mL) and wash the combined methylene chloride solutions with water (100mL). Distill off solvent at atmospheric pressure until the pot temperature reaches 120C. Cool the residue 15 and dilute with 2B absolute ethanol (200mL). Heat the solution to 70C and sparge in anhydrous HCl (20g) over 10 minutes. After 40 minutes, cool the reaction and hold overnight under nitrogen. Evaporate the solvent in vacuo to give the title compound (258g).

20

Example 11

Step k: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic
acid, ethyl ester

Method A: Dissolve 2-(4-cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester (100g) in xylene (500mL) and ethanol (100mL) and heat to 70°C. Sparge the atmosphere of the reaction with hydrogen chloride gas (24.6g) over 220 hours. Evaporate the solvent in vacuo to give the title compound.

Method B: Add a solution of 5M HCl in acetonitrile (50mL, 9g of HCl, 247mmol) to 2-(4-cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester (25.5g, 98mmol) and seal in a 100mL flask with a rubber septum. Heat to 50°C for 4 hours, dilute with toluene (50mL), wash with water (50mL), aqueous 10% Na2CO3 (50mL) and then water (50mL). Evaporate the solvent invacuo to give the title compound as an oil

(27.2g).

Method C: Place 2-(4-cyclopropanecarbonyl-phenyl)-25 methyl-propionic acid, ethyl ester (86g, 330mmol) and dry acetonitrile (70mL) in a 250mL 3-neck round-bottom flask equipped with a magnetic stirbar, thermometoer, gas inlet and distillation head connected to a balloon by way of a T fitting for pressure control. Slowly warm the reaction
10 mixture with stirring to 60°C while sparging excess HCl into the reaction mixture for 6 hours, dilute with toluene (50mL), wash with water (50mL), aqueous 10% Na2CO3 (50mL) and then water (50mL). Evaporate the solvent in vacuo to give the title compound.

15

Method D: Place 2-(4-cyclopropanecarbonyl-phenyl)-2methyl-propionic acid, ethyl ester (9lg, 350mmol) in a l L
3-neck round-bottom flask equipped with a magnetic stirbar,
thermometer, gas inlet, and distillation head connected to
20 a balloon by way of a T fitting for pressure control.
Slowly sparge in anhydrous HCl, keeping the balloon
slightly inflated. After 10 minutes, add acetonitrile
(590mL), heat to 65°C and add excess HCl over 7 hours.
Heat the mixture and remove acetonitrile/HCl overhead.
25 After 500mL of acetonitrile is removed, add mixed xylene
(200mL) and continue the distillation. Add additional
xylene (200m) and after a total of 640mL of solvent has
been removed (pot = 130°C and overhead =130C°), add ethanol
2B (100mL). Remove the ethanol by distillation to give the
title compound as a oil (330g).

Method E: Place 2-(4-cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester (98g, 410mmol) and xylenes (600mL) in a 1L 3-neck round-bottom flask equipeed with a magnetic stirbar, thermomoter, gas inlet and distillation head connected to a balloon by way of a T fitting for pressure control. Heat the reaction mixture to 80°C and slowly sparge in anhydrous HCl. After 100

minutes, add ethanol 2B (100mL) and HCl (26g) and heat to 35°C for 2 hours. Remove the ethanol and HCl by distillation with aspirator vacuum (pot = 35°C, overhead = 30°C) to give the title compound as a solution in xylene.

Method F: Place 2-(4-cyclopropanecarbonyl-phenyl)-2methyl-propionic acid, ethyl ester (500g) in a 4L Hastelloy
reactor equipped with a gas inlet, overhead stirrer,
temperature control and dip pipe for sampling. Heat the
oil to 60C and evacuate the head space. Add HCl raising
the pressure to lopsig and react for 80-300 minutes. Vent
the excess HCl and sparge the oil with nitrogen for 5
minutes to give the title compound.

15

Method G: Pit a 2L 3-neck round bottom flask with an overhead paddle stirrer, a gas sparge tube (with fritted end to disperse gas) and a reflux condenser (with drying tube on top, filled with drying agent). Pit the bottom of 20 the flask with a heating mantle and put 2-(4cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester (78.10g, 0.300 mol), xylenes (400mL) and absolute 2B ethanol (90mL) into the flask. Stir to dissolve all the solids at ambient temperature. Sparge hydrogen chloride 25 from a lecture bottle (38.36g, 1.052 mol) into the stirred solution without external heating over a 15 minute period. Replace the sparge tube with a glass stopper and heat the solution by mantle, with stirring, at 40-79C for 45 minutes and 79C for 15 minutes. Replace the reflux condenser with 30 a simple still head fitted with a thermometer and condenser. Collect 200 mL of distillate (80-138C at atmospheric pressure) and allow the remaining light yellow solution to cool to give a mixture of the title compound and xylenes.

15

Step t: (4-Cyclopropanecarbonyl-phenyl)-acetic acid, ethyl ester and (3-Cyclopropanecarbonyl-phenyl)-acetic acid, ethyl ester

Dissolve the mixture of [4-(4-chloro-butyryl)-phenyl]acetic acid, ethyl ester and [3-(4-chloro-butyryl)-phenyl]acetic acid, ethyl ester (650g) in 2B ethanol (1250mL).

Add, by dropwise addition, a solution of 2B ethanolic KOH
(168g in 1000mL), keeping the temperature below 10C. After
the addition, stir magnetically for 5 hours at -10C. Bring
the mixture to pH 6 with acetic acid (5mL) and filter
through a celite pre-coat. Evaporate the solvent in vacuo
to give the title compound as an oil (538g).

Example 12

Step d: [4-(4-Chloro-butyryl)-phenyl]-acetic acid, 2ethylhexyl ester

Mix 2-ethyl-1-hexanol (6.5g, 5mol), triethylamine (50.5g, 0.5mol) and methylene chloride (50mL). Add, by dropwise addition, 2-phenylacetyl chloride (5mol) and warm to 50°C. Stir at room temperature overnight, filter and wash the filtercake with methylene chloride (50mL). Combine the organic phases and wash with 5% aqueous hydrochloric acid (50mL) and water. Dry (MgSO₄), evaporate the solvent in vacuo and purify by distillation to give 2-phenylacetic acid, 2-(2-ethylhexy)l ester.

Mix chlorobutyryl chloride (16.9g) and AlCl₃ (29.3g) at room temperature. Add 2-phenylacetic acid, 2-ethylhexyl ester (27.6g), keeping the temperature below 10°C. Heat at 35°C for 24 hours, quench in ice water (200g). Separate the organic phase, dry (MgSO₄) and evaporate the solvent in vacuo. Dilute the residue with ethanol (150mL), add hydrogen chloride (5g) and heat to 75°C. After 2.5 hours, add another 5g of hydrogen chloride and stir at 75°C for 24 hours. Evaporate the solvent in vacuo to give the title compound.

solvent in vacuo to give a mixture of 2-(4cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl
ester and 2-(3-cyclopropanecarbonyl-phenyl)-2-methylpropionic acid, ethyl ester as an oil (57.1g) Purify by one
of the following methods:

Method A: Pack a 31/32 in. I.D. vacuum jacked and silvered column with 53 inches of 1 in. diameter, 316 stainless 10 steel packing. For high temperature distillation, the column is fitted with an adiabatic jacket composed of an inner layer of 1 in. fiber glass wrapped with heat tape in an upper and lower zone and finally covered with 2 in. fiber glass insulation. The upper zone is heated at 135C 15 and the lower zone at 185C. The magnetic reflux splitting head is controlled by a reflux timer and fitted with a standard thermometer for monitoring overhead temperature. Vacuum is supplied by a system composed of a pump protected by a dry ice trap and fitted with a McLeod gage for 20 monitoring the overhead pressure. The 1L distillation pot is heated with an electric mantel at 65 volts, agitated magnetically and fitted with a mercury manometer for monitoring bottoms pressure, and a thermocouple for monitoring bottoms temperature.

The still pot is charged with 265 g each of m- and p-xylene and fitted with a rubber septum for sampling by syringe. The xylene mixture is heated at total reflux and atmosphere pressure with the temperature 135C at the head and 139C in 30 the bottoms. Samples are withdrawn for analysis by collecting a few drops of distillate and extracting about lmL from the pot. The still is sampled after 3 hours and again after 18 hours for calibration by GC and theoretical plate calculations using the Fenske correlation and a 35 relative volatility, q=1.0209.

Charge the mixture of 2-(4-cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester and 2-(3-

-83-

cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester (901.2g) to the still pot and heat at total reflux until the column has equilibrated. Take a forecut at 2:1 5 reflux ratio and increase the reflux ratio to 5:1 and the 2-(3-cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester stripped. Cool and release vacuum and allow to sit overnight. Add bis(2-ethylhexyl)phthalate (dioctyl phthalate) (100mL) to the still pot and restart the still 10 as before. Once the still has equilibrated, collect mixed fractions of 2-(4-cyclopropanecarbonyl-phenyl)-2-methylpropionic acid, ethyl ester and 2-(3-cyclopropanecarbonylphenyl)-2-methyl-propionic acid, ethyl ester at 10:1 reflux ratio. Once the overheads are free of 2-(3-15 cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester by GC analysis, reduce the reflux ratio to 2:1 and collect the title compound.

Method B: Place crude mixture of 2-(4-

- cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester and 2-(3-cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester (4872g) on a rotary evaporator and strip of vaolatives to an end point of 85C, 15mm to give a brown oil (4006g). Charge a 3L round bottom three neck flask equipped with magnetic stirbar, thermometer and distillation head with stripped crude mixture of 2-(4-cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester and 2-(3-cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester. Distill the oil at 0.5mm Hg and discard a light fraction boiling at 25-130C (pot temp-105-165C, 9.5g). Continue distilling the oil at 0.5mm Hg and collect a second fraction boiling at 130-150C (pot temperature 165-190, 3217g).
- 35 Place the crude flash distilled product (1000g) in a 4L Hastelloy reactor equipped with Camille control along with water (500mL) and ethanol 2B (2L). Heat the mixture to 40C while agitating at 400 rpm. Set the reactor jacket to cool

the contents at approximately 12C/hour to a final temperature of 0C after a clear solution is observed. Then set the jacket to cool the reactor contents at

5 approximately 12C/hour to a final temperature of -15C and hold at that temperature for more than one hour. Filter the slurry, wash with cold (-15C) ethanol, cold heptanes (-15C) and dry to give a solid (507g). Purify by recrystallization from mixed heptanes as above to give the title compound (503g) after drying.

Example 15

Step h and step 1: 2-(4-Cyclopropanecarbonyl-phenyl)-2methyl-propionic acid, ethyl ester and 2-(3-

15 <u>Cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl</u> ester

Method A: Place aluminum chloride (586g, 4.4moles) and methylene chloride (300mL) in a 2L 3-neck round bottom

- 20 flask equipped with an overhead stirrer, dry ice condenser, and nitrogen atmosphere. Cool to 10C and add, by dropwise addition, chlorobutyryl chloride (338g, 2.4moles), keeping the temperature below 15C. After addition is complete, add, by dropwise addition, ethyl 2-methyl-2-
- 25 phenylpropionate (384g, 2mol), keeping the temperature below 15C. After addition was complete, warm the reaction mixture to 22C and stir for 1 hour. Raise the temperature to 90C, stir for 90 minutes, cool to room temperature and slowly pounr into a 6L stirred flask containing ice/water
- 30 (4kg). Filter through a celite precoat, separate the organic phase and wash the aqueous phase with methylene chloride (50mL). Evaporate the solvent in vacuo to give a mixture of 2-[4-(4-chloro-butyryl)-phenyl]-2-methyl-proprionic acid, ethyl ester and 2-[3-(4-chloro-butyryl)-
- 35 phenyl]-2-methyl-proprionic acid, ethyl ester.

Dissolve the mixture of 2-[4-(4-chloro-butyryl)-phenyl]-2-methyl-proprionic acid, ethyl ester and 2-[3-(4-chloro-

butyryl)-phenyl]-2-methyl-proprionic acid, ethyl ester in 2B ethanol (400mL) and place in a 3L 3-neck round bottom flask equipped with an overhead stirrer, gas inlet and reflux condenser. Add anhydrous HCl (50g) and sitr the mixture at 70C for l hour. Cool the solution to 15C and add, by dropwise addition, aqueous 50% NaOH (260g), keeping the temperature below 15C. After the addition, stir the mixture an addition l hour at 22C. Add toluene (700mL) followed by acetic acid (2g) and then water (500mL). Separate the layers and evaporate the solvent in vacuo to give the title compuond as a yellow oil (55lg).

Method B: Place aluminum chloride (458g, 3.4mole) and
methylene chloride (234mL) in a 2L 3nck round bottom flask
equipped with an overhead stirrer, dry ice condenser and
nitrogen atmosphere. Cool to 10C and add, by dropwise
addition, 4-chlorobutyryl chloride (264g, 1.9mol), keeping
the temperature below 15C. After addition is complete,
add, by dropwise addition, ethyl 2-methyl-2phenylpropionate (300g, 1.56mol), keeping the temperature
below 15C. After the addition is complete, warm the
reaction mixture to 24C and stir for 1 hour. Raise the
temperature to 57C for 2 hours, cool to room temperature
and slowly pour into a 6L stirred flask containing
ice/water (3.1kg). Filter through a celite precoat and
separate the phases. Evaporate the solvent in vacuo to
give an oil.

Dissolve the oil in 2B ethanol (312mL) and place in a 3L 3 neck round bottom flask equiped with an overhead stirrer, gas inlet and reflux condenser. Add anhydrous HCl (39g)—and stir the mixture at 70C for 1 hour. Cool to 50C and add, by dropwise addition, aqueous 20% NaOH (64lg), keeping the temperature below 50C. After the addition, stir the mixture for an additional 1 hour at 50C, cool to room temperature and neutralize with acetic acid (6.25g).

5

Separate the layers and evaporate the solvent in vacuo to give the title compound (391g).

<u>Example 16</u>

Step h and step 1: 2-(4-Cyclopropanecarbonyl-phenyl)-2methyl-propionic acid, 2-ethylhexyl ester
Mix methylene chloride (50mL), 2-ethylhexyl alcohol (130g,
lmol) and triethylamine (50g, 0.5mol). Add, by dropwise

10 addition, ethyl dimethylphenylacetyl chloride (91g,
0.5mol). Heat the reaction mixture to 68C for 1 hour, add
methylene chloride (100mL) and stir overnight. Remove the
solids by filtration, wash with methylene chloride (50mL),
combine with the liquid organics, wash with aqueous 5% HCl,
15 (50mL), water (50mL) and dry over MgSO4. Evaporate the
solvent in vacuo and purify by distillation (119 C at
lmmHg) (105g, 76%).

Place aluminum chloride (29.3g) and methylene chloride 20 (30mL) in a 250mL round bottom flask with an overhead stirrer, temperature control, condenser, additional funnel and nitrogen atmosphere. Add, by dropwise addition, chlorobutyryl chloride (16.9g), keeping the temperature below 10C. After addition is complete, warm the reaction 25 mixture to 36C and hold for 24 hours. Quench the reaction mixture into ice/water (200g) and extract with methylene chloride (50mL). Wash the organics with water (50mL) and dry (MgSO4). Evaporate the solvent in vacuo to give an oil (30g). Place the oil in a 250mL flask equipped with an 30 overhead stirrer, gas inlet, condenser and thermometer. Add 2B ethanol (150mL) followed by anhydrous HCl (5g). Heat the reaction mixture to 76C for 2.5 hours then add additional HCl (5g). Heat the reaction mixture at 76C for 22 hours, evaporate the solvent in vacuo to give an oil. 35 Dissolve the oil in 2B ethanol (100mL), treat with solid KOH (10q) and heat at reflux for 2 hours.

Example 17

Step m and step 1: 2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid, ethyl ester

Dissolve 2-[4-(4-chloro-butyryl)-phenyl]-acetic acid, ethyl ester (28.5g) in toluene (50mL) and evaporate the solvent in vacuo to remove traces of ethanol. Dissolve the residue in diglyme (50mL) and add, by dropwise addition, to a suspension of sodium hydride (12.2g of a 60% suspension in 10 mineral oil) slurried in diglyme (150mL) containing methyl chloride (10g). Slowly add methyl chloride (10g) and stir for 15 minutes. Pilter through filter aid, wash filtercake with acetonitrile and evaporate the solvent. Remove metaisomer by distillation (150°C @ lmm) and crystallize (ethanol) to give the title compound (93%).

Example 18

Step f and step: 2-(4-Cyclopropanecarbonyl-phenyl)propionic acid, ethyl ester and 2-(3-Cyclopropanecarbonyl-

20 phenyl)-propionic acid, ethyl ester
Dissolve 2-phenylpropionic acid (30g) in 2B ethanol (100mL and add anhydrous HCl (10g). Allow to sit for 48-72 hours, evaporate the solvent in vacuo and purify by distillation to give ethyl 2-phenylpropionate (31g); bp 100C at 6mmm.

25

Place aluminum chloride (49.4g, 0.371mole) and methylene chloride (50mL) in a 250mL 3-neck round bottom flask equipped with an overhead stirrer, addition funnel and thermometer. Cool to less then 10C and add, by dropwise addition, chlorobutyrylchloride (23.8g, 0.202mol), keeping the temperature below 10C. After addition is complete, add, by dropwise addition, ethyl 2-phenylpropianate (30g, 0.17mol), keeping the temperature below 10C. Stir at room temperature for 1 hour then heat at reflux for 14 hours.

35 Quench into ice/water (350g) and filter through a celite pre-coat. Separate the layers and evaporate the solvent in vacuo to give a red oil.

15

Dissolve the red oil in 2B ethanol (35mL) and place in a round bottom flask with a condenser and gas inlet. Add anhydrous HCl (4.3g) and heat the solution to 70C for 1 hour. Cool the solution to 10C and add, by dropwise addition, 20% aqueous sodium hydroxide. Separate the layers and evaporate the solvent in vacuo to give an oil.

Re-treat the oil with HCl in 2B ethanol as above, cool to 10 10C and treat with a 20% solution of sodium ethoxide in ethanol. Neutralize with acetic acid, filter the solids and evaporate the solvent in vacuo. Purify by distillation to give the title compound; bp 161-167 at 1.2mm.

Example 19

Step h: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, ethyl ester and 2-[3-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, ethyl ester

Place AlCl₃ (146.5g. 1.1mol) and methylene chloride (75mL)

20 in a 3-neck, 500mL round-bottomed flack equippred with an overhead stirrer, bottom drop valve, thermometer, condenser and temperature control and cool to 15°C. Add, by dropwise addition, 4-chlorobutyryl chloride (84.5g, 0.6mol), keeping the temerature below 15°C. Add, by dropwise addition,

25 ethyl 2-methyl-2-phenylpropionate (96g, 0.5mol), keeping the temperature below 15° C. After addition is complete, stir the reaction mixture at 22°C for 1 hour, then heat at reflux (57°C) for 2 hours. Add the reaction mixture, by dropwise addition, by way of the bottom drop valve, to

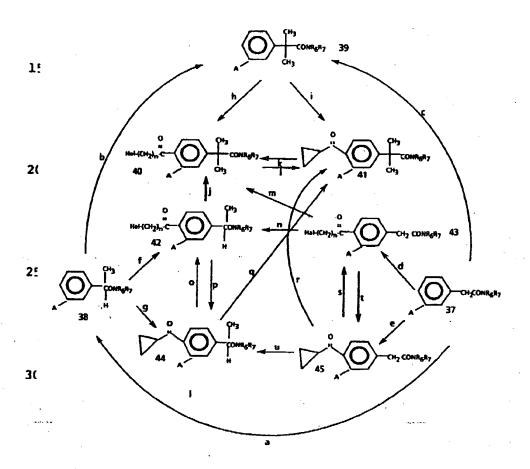

at 95°C contained in a 2L 3 neck flask equipped with a magnetic stirbar, thermometer and distillation head. During addition, hold the reaction mixture at 70°C by allowing the methylene chloride to distill overhead. After the quench is complete, separate

35 the the organic layer, dry (MgSO₄) and evaporate the solvent in vacuo to give the title compound (150g).

The novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is CONR₆R₇ may also be prepared as described in Scheme G. In Scheme G, all substituents are as previously defined unless otherwise indicated.

Scheme G

1(

35

Scheme G provides alternative various general synthetic procedures for preparing the novel intermediates of formula (II), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is CONR₆R₇.

In step a, the appropriate phenylacetic acid amide compound of structure (37) is methylated to give the corresponding a-methylphenylacetic acid amide compound of structure (38) as described previously in Scheme A, step a.

Appropriate phenylacetic acid amide compound of structure (37) are prepared from the corresponding phenylacetic acid by standard amide-forming reactions as are known in the art. The appropriate phenylacetic acids may be prepared by hyrdolysis of the corresponding 2-cyano-2-propylbenzene compound of structure (27) by techniques and procedures well known and appreciated by one of ordinary skill in the art.

20

In step b, the appropriate α-methylphenylacetic acid amide compound of structure (38) is methylated to give the corresponding α,α-dimethylphenylacetic acid amide compound of structure (39) as described previously in Scheme A, step a.

Appropriate α-methylphenylacetic acid amide compound of structure (38) are prepared from the corresponding α-methylphenylacetic acid by standard amide-forming reactions as are known in the art as as described in step a.

In step c, the appropriate phenylacetic acid amide compound of structure (37) is dimethylated to give the corresponding α,α-dimethylphenylacetic acid amide compound of structure (39) as described previously in Scheme A, step c.

In step d, the appropriate phenylacetic acid amide compound of structure (37) is acylated with an appropriate ω-halo compound of the structure Hal-(CH₂)_n-C(=0)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding ω'-halo-α'-keto-phenylacetic acid amide compound of structure (43) as described previously in Scheme A, step d.

In step e, the appropriate phenylacetic acid amide compound of structure (37) is acylated with an appropriate cyclopropyl compound of the structure

15

wherein B is as previously defined to give the corresponding cyclopropylketo-phenylacetic acid amide compound of structure (45) as described previously in Scheme A, step e.

In step f, the appropriate α -methylphenylacetic acid amide compound of structure (38) is acylated with an appropriate ω -halo compound of the structure Hal-(CH₂)_n-C(=0)-B, wherein B is Hal or hydroxy, Hal is Cl. Br or I and n is as previously defined to give the corresponding ω '-halo- α '-keto- α -methylphenylacetic acid amide compound of structure (42) as described previously in Scheme A, step d.

30

In step g, the appropriate α -methylphenylacetic acid amide compound of structure (38) is acylated with an appropriate cyclopropyl compound of the structure

35

wherein B is as previously defined to give the
 corresponding cyclopropylketo-α-methylphenylacetic acid
 amide compound of structure (44) as described previously in
5 Scheme A, step e.

In step h, the appropriate α,α-dimethylphenylacetic acid amide compound of structure (39) is acylated with an appropriate ω-halo compound of the structure Hal-(CH₂)_n-10 C(=0)-B, wherein B is Hal or hydroxy, Hal is Cl, Br or I and n is as previously defined to give the corresponding ω'-halo-α'-keto-α,α-di-methylphenylacetic acid amide compound of structure (40) as described previously in Scheme A, step d.

15

Appropriate α,α-dimethylphenylacetic acid amide compound of structure (39) are prepared from the corresponding α,α-dimethylphenylacetic acid by standard amide-forming reactions as are known in the art as as described in step a.

In step i, the appropriate α,α -dimethylphenylacetic acid amide compound of structure (39) is acylated with an appropriate cyclopropyl compound of the structure

25

- wherein B is as previously defined to give the corresponding cyclopropylketo-α,α-dimethylphenylacetic acid amide compound of structure (41) as described previously in Scheme A, step e.
- In step j, the appropriate ω'-halo-α'-keto-αmethylphenylacetic acid amide compound of structure (42) is
 methylated to give the corresponding ω'-halo-α'-keto-α,α-

di-methylphenylacetic acid amide compound of structure (40) as described previously in Scheme a, step a.

5 In step k, the cyclopropyl functionality of the appropriate cyclopropylketo-α,α-dimethylphenylacetic acid amide compound of structure (41) is ring-opened to give the corresponding ω'-halo-α'-keto-α,α-di-methylphenylacetic acid amide compound of structure (40) wherein n = 3 as
10 described previously in Scheme A, step j.

In step 1, the appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetic acid amide compound of structure (40)
wherein n = 3 is ring-closed to give the corresponding

cyclopropylketo-α,α-dimethylphenylacetic acid amide
compound of structure (41) as described previously in
Scheme A, step k.

In step m, the appropriate ω'-halo-α'-keto-phenylacetic
20 acid amide compound of structure (43) is dimethylated to give the corresponding ω'-halo-α'-keto-α,α-di-methylphenylacetic acid amide compound of structure (40) as described previously in Scheme A, step c.

In step n, the appropriate ω' -halo- α' -keto-phenylacetic acid amide compound of structure (43) is methylated to give the corresponding ω' -halo- α' -keto- α -methylphenylacetic acid amide compound of structure (42) as described previously in Scheme A, step a.

30

In step o, the cyclopropyl functionality of the appropriate cyclopropylketo- α -methylphenylacetic acid amide compound of structure (44) is ring-opened to give the corresponding ω' -halo- α' -keto- α -methylphenylacetic acid amide compound of structure (42) wherein n = 3 as described previously in Scheme A, step j.

In step p, the appropriate ω'-halo-α'-keto-αmethylphenylacetic acid amide compound of structure (42)
wherein n = 3 is ring-closed to give the corresponding
cyclopropylketo-α-methylphenylacetic acid amide compound of structure (44) as described previously in Scheme A, step k.

In step q, the appropriate cyclopropylketo-αmethylphenylacetic acid amide compound of structure (44) is
10 methylated to give the corresponding cyclopropylketo-α,αdimethylphenylacetic acid amide compound of structure (41)
as described previously in Scheme A, step a.

In step r, the appropriate cyclopropylketo-phenylacetic acid amide compound of structure (45) is dimethylated to give the corresponding cyclopropylketo-a,a-dimethylphenylacetic acid amide compound of structure (41) as described previously in Scheme A, step c.

In step s, the cyclopropyl functionality of the appropriate cyclopropylketo-phenylacetic acid amide compound of structure (45) is ring-opened to give the corresponding ω'-halo-α'-keto-phenylacetic acid amide compound of structure (43) wherein n = 3 as described previously in Scheme A, step j.

In step t, the appropriate ω'-halo-α'-keto-phenylacetic
acid amide compound of structure (43) wherein n = 3 is
ring-closed to give the corresponding cyclopropylketo30 phenylacetic acid amide compound of structure (45) as
described previously in Scheme A, step k.

In step u, the appropriate cyclopropylketo-phenylacetic acid amide compound of structure (45) is methylated to give the corresponding cyclopropylketo-α-methylphenylacetic acid amide compound of structure (44) as described previously in Scheme A, step a.

Starting materials for use in Scheme G are readily available to one of ordinary skill in the art.

The following example present typical syntheses as described in Scheme G. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "µL" refers to microliters; "µg" refers to micrograms; and "µM" refers to micromolar.

15

Example 20

Step h: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, N-methoxy-N-methylamide

Dissolve 2-methyl-2-phenyl-propionic acid (15.0g, 91.2mmol) 20 in toluene (80mL) and add, by dropwise addition over 5 minutes, thionyl chloride (15mL, 206mmol). Stir at room temperature overnight, add additional thionyl chloride (3mL, 41.1mmol) and heat to reflux for 1 hour. Remove excess thionyl chloride by azeotropic distillation with 25 toluene (40mL). Add toluene (20mL) to the reaction mixture along with a solution of potassium carbonate (28.0g, 203mmol) in water (40mL). Add, by dropwise addition, a solution of N,O-dimethylhydroxylamine hydrochloride (8.9g. 91.2mmol) in water (20mL) without cooling and stir for 2 30 hours. Add tert-butylmethyl ether (75mL) following by slow addition of aqueous HCl (2N, 75mL) with vigorous stirring. Separate the organic layer and wash with aqueous HCl (2N, 75mL), saturated sodium hydrogen carbonate (25mL) and brine (50mL). Dry the organic layer over (Na₂SO₄), filter, 35 evaporate the filtrate in vacuo and purify by vacuum distillation to give 2-methyl-2-phenyl-propionic acid, N-

methoxy-N-methylamide (18.0g, 95%); bp 91-103°C/5mm Hg.

MS (CI, CH₄) m/e 208 (M^++1 , 100), 119.

Slurry AlCl₃ (10.15g, 76.1mmol) and methylene chloride

(45mL) under a nitrogen atmosphere at room temperature.

Add 4-chlorobutyryl chloride (4.27mL, 38.1mmol), stir for

20 minutes and add, by dropwise addition over 10 minutes, a

solution of 2-methyl-2-phenyl-propionic acid, N-methoxy-N
methylamide (6.58g, 31.7mmol) in methylene chloride (15mL).

Stir at room temperature for 45 minutes, then heat at 30
35°C for 7 hours. Pour into ice water (150mL) and separate

the layers. Wash the aqueous layer with water (3X75mL),

combine the aqueous layers and extract with methylene

chloride (2X75mL). Combine the organic layers and dry

(Na₂SO₄). Filter, evaporate the filtrate in vacuo and purify

by silica gel chromatography (3:1 hexane/ethyl acetate) to

give the title compound (6.19g, 63%) as a light yellow oil.

MS (CI,CH₄) m/e 312 (M⁺+1), 276.

20

Example 21

Step h: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, dimethylamide

Dissolve 2-methyl-2-phenyl-propionic acid (15.0g, 91.2mmol)
in toluene (80mL) and add, by dropwise addition over 5
minutes, thionyl chloride (15mL, 206mmol). Stir at room
temperature overnight, add additional thionyl chloride
(3mL, 41.1mmol) and heat to reflux for 1 hour. Remove
excess thionyl chloride by azeotropic distillation with
toluene (40mL). Add toluene (20mL) to the reaction mixture
along with a solution of potassium carbonate (28.0g,
203mmol) in water (40mL). Add, by dropwise addition, a 40%
aqueous solution of dimethylamine hydrochloride (20mL,
0.18mol) without cooling and stir for 2 hours. Add tertbutylmethyl ether (75mL) following by slow addition of
aqueous HCl (2N, 75mL) with vigorous stirring. Separate
the organic layer and wash with aqueous HCl (2N, 75mL),
saturated sodium hydrogen carbonate (25mL) and brine

(50mL). Dry the organic layer over (Na₂SO₄), filter, evaporate the filtrate *in vacuo* and purify by crystallization to give 2-methyl-2-phenyl-propionic acid, dimethylamide 5 (15.35g, 88%) as a white solid; mp 57-59°C.

Anal. Calcd for $C_{12}H_{17}NO$: C, 75.35; H, 8.96; N, 7.32; Found: C, 75.12; H, 8.86; N, 7.26.

10 Add AlCl₃ (1.12g, 8.40mmol) to carbon tetrachloride (6mL) under a nitrogen atmosphere at room temperature. Add 4-chlorobutyryl chloride (0.49mL, 4.37mmol), stir for 15 minutes and add, by dropwise addition over 3 minutes, a solution of 2-methyl-2-phenyl-propionic acid, dimethylamide (0.64g, 3.36mmol) in carbon tetrachloride (6mL). Stir at room temperature for 17 hours, dilute with methylene chloride (10mL), pour into ice water (50mL) and separate the layers. Wash the aqueous layer with methylene chloride (2X70mL), 5% aqueous sodium hydrogen carbonate, combine the organic layers and dry (Na₂SO₄). Filter, evaporate the filtrate invacuo and purify by silica gel chromatography (5:2 hexane/ethyl acetate) to give the title compound (0.72g, 72%) as a light yellow oil.

25 Example 22

Step h: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, pyrrolidineamide

Dissolve 2-methyl-2-phenyl-propionic acid (15.0g, 91.2mmol) in toluene (80mL) and add, by dropwise addition over 5

30 minutes, thionyl chloride (15mL, 206mmol). Stir at room temperature overnight, add additional thionyl chloride (3mL, 41.1mmol) and heat to reflux for 1 hour. Remove excess thionyl chloride by azeotropic distillation with toluene (40mL). Add tolune (20mL) to the reaction mixture 35 along with a solution of potassium carbonate (28.0g, 203mmol) in water (40mL). Add, by dropwise addition,

203mmol) in water (40mL). Add, by dropwise addition, pyrrolidine (7.6lmL, 9lmmol) without cooling and stir for 2 hours. Add tert-butylmethyl ether (75mL) following by slow

addition of aqueous HCl (2N, 75mL) with vigorous stirring. Separate the organic layer and wash with aqueous HCl (2N, 75mL), saturated sodium hydrogen carbonate (25mL) and brine (50mL). Dry the organic layer over (Na₂SO₄), filter, evaporate the filtrate *in vacuo* and purify by crystallization to give 2-methyl-2-phenyl-propionic acid, pyrrolidineamide (18.28g, 92%) as a solid; mp 96-97°C.

10 Anal. Calcd for C₁₄H₁₉NO: C, 77.38; H, 8.81; N, 6.45; Found: C, 77.21; H, 8.70; N, 6.41.

Add AlCl₃ (8.31g, 62.3mmol) to carbon tetrachloride (65mL) under a nitrogen atmosphere at room temperature. Add 415 chlorobutyryl chloride (03.5mL, 31.2mmol), stir for 15 minutes and add, by dropwise addition over 15 minutes, a solution of 2-methyl-2-phenyl-propionic acid, pyrrolidineamide (5.64g, 26.0mmol) in carbon tetrachloride (60mL). Stir at room temperature for 17 hours, pour into ice water (100mL) and separate the layers. Wash the aqueous layer with methylene chloride (2X70mL), 5% aqueous sodium hydrogen carbonate, combine the organic layers and dry (Na₂SO₄). Filter, evaporate the filtrate invacuo and purify by silica gel chromatography (5:2 hexane/ethyl acetate) to give the title compound (6.55g, 78%) as a light yellow oil.

Example 23

Step 1: 2-(4-Cyclopropanecarbonyl-phenyl)-2-methylpropionic acid, N-methoxy-N-methylamide
Add potassium hydroxide (13g) to 2-[4-(4-chloro-butyrylphenyl]-2-methyl-propionamide, N-methoxy-N-methylamide
(96.6mmol) and stir at room temperature for 40 minutes,
filter and wash the filtercake with ethanol. Evaporate the
ethanol in vacuo, dissolve in methylene chloride (100mL),
wash with water (50mL), 5% sodium hydrogen carbonate (50mL)
and water (50mL). Evaporate the solvent in vacuo, removing
water with toluene azeotrope. Purify the product by

distillation followed by recrystallization (heptane) to give the title compound (7.4g).

5 The following compounds can be prepared by procedures depicted in Scheme G:

(4-cyclopropanecarbonyl-phenyl)-acetic acid, N-methoxy-N-methylamide;

10

(4-cyclopropanecarbonyl-phenyl)-acetic acid, dimethylamide;

(4-cyclopropanecarbonyl-phenyl)-acetic acid,
pyrrolidineamide;

15

2-(4-Cyclopropanecarbonyl-phenyl)-proprionic acid, N-methoxy-N-methylamide;

2-(4-Cyclopropanecarbonyl-phenyl)-proprionic acid,
20 dimethylamide;

2-(4-Cyclopropanecarbonyl-phenyl)-proprionic acid, pyrrolidineamide;

25 2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl-proprionic acid, N-methoxy-N-methylamide;

2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl-proprionic acid, dimethylamide;

30

2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl-proprionic acid, pyrrolidineamide;

[4-(4-Chloro-butyryl)-phenyl]-acetic acid, N-methoxy-N35 methylamide;

[4-(4-Chloro-butyryl)-phenyl]-acetic acid, dimethylamide;

[4-(4-Chloro-butyryl)-phenyl]-acetic acid, pyrroldineamide;

2-[4-(4-Chloro-butyryl)-phenyl]-propionic acid, N-methoxy-5 N-methylamide;

2-[4-(4-Chloro-butyryl)-phenyl]-propionic acid,
dimethylamide;

10 2-[4-(4-Chloro-butyryl)-phenyl]-propionic acid,
 pyrroldineamide;

2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, N-methoxy-N-methylamide;

2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid,
dimethylamide;

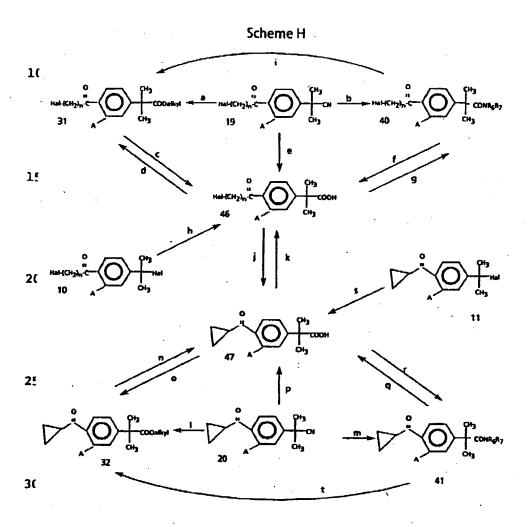

2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid,
20 pyrroldineamide;

25

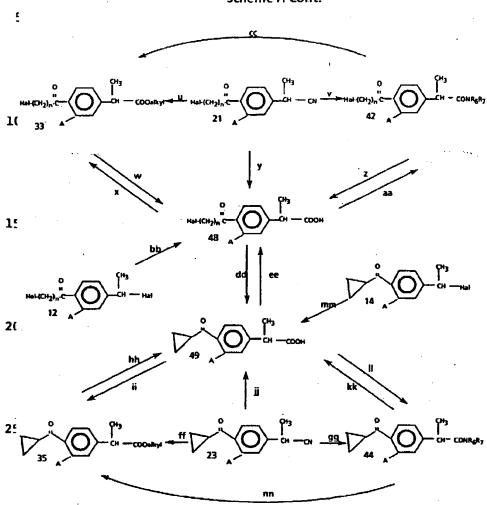

30

35

The novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is COOH, COOalkyl or CONR₆R₇ may be prepared as described in Scheme H. In Scheme H, all substituents are as previously defined unless otherwise indicated.

Scheme H Cont.

3(

Scheme H Cont.

31

Scheme H provides various general synthetic procedures for preparing the novel intermediates of formula (II), formula (III), formula (IV), formula (V), formula (VI) and formula (VII) wherein R₅ is COOH, COOalkyl or CONR₆R₇.

In step a, the nitrile functionality of the appropriate ω -halo-cyanocumylketone compound of structure (19) is

converted to the corresponding ester by reaction with an appropriate C_1 to C_6 alcohol to give the corresponding ω' -halo- α' -keto- α , α -dimethylphenylacetic acid ester compound of structure (31).

For example, the ω '-halo- α '-keto- α , α dimethylphenylacetic acid ester compound of structure (31) may be prepared by reacting an appropriate ω-halo-10 cyanocumylketone compound of structure (19) with an appropriate C1-C6 alcohol in the presence of a suitable anhydrous acid followed by treatment with water. Examples of appropriate alcohols are methanol, ethanol, propanol, and the like, with methanol being preferred. Examples of 15 appropriate acids are hydrogen chloride and hydrogen bromide, with hydrogen chloride being preferred. The reaction time varies from about 1/2 hour to 48 hours, preferably 3 to 5 hours and the reaction temperature varies from about -20°C to room temperature, preferably -10°C to 20 0°C. The ω' -halo- α' -keto- α , α -dimethylphenylacetic acid ester compound of structure (28) is recovered from the reaction zone by evaporation of the solvent followed by extraction as is known in the art. The ω'-halo-α'-ketoa,a-dimethylphenylacetic acid ester compound of structure 25 (31) may be purified by procedures well known in the art, such as chromatography.

In step b, the nitrile functionality of the appropriate ω-halo-cyanocumylketone compound of structure (19) is
converted to the corresponding amide to give the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid amide compound of structure (40) wherein R₆ and R₇ are both hydrogen.

For example, hydrolysis may be achieved by using a 35 suitable acid, such as concentrated hydrochloric acid as is known in the art.

In step c, the carboxy ester functionality of the appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound of structure (31) is hydrolyzed to give the corresponding ω'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46).

For example, hydrolysis may be achieved by using a suitable non-nucleophilic base, such as sodium methoxide in methanol as is known in the art. Other methods known in the art for ester cleavage include potassium carbonate in methanol, methanolic ammonia, potassium carbonate, potassium hydroxide, calcium hydroxide, sodium hydroxide, magnesium hydroxide, sodium hydroxide/pyridine in methanol, potassium cyanide in ethanol and sodium hydroxide in aqueous alcohols, with potassium hydroxide being preferred. The reaction is typically carried out in an aqueous lower alcohol solvent, such as methanol, ethanol, isopropyl alcohol, n-butanol, 2-ethoxyethanol or ethylene glycol or pyridine, at temperatures ranging from room temperature to the reflux temperature of the solvent, and the reaction time varies from about 1/2 hour to 100 hours.

In step d, the carboxy functionality of the appropriate w'-halo-a'-keto-a,a-dimethylphenylacetic acid compound of structure (46) may be esterified by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding w'-halo-a'-keto-a,a-dimethylphenylacetic acid ester compound of structure 30 (31).

For example, one such method involves reacting an appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46) with an excess of an appropriate 35 C₁-C₆ alcohol which is straight or branched in the presence of a small amount of mineral acid, such as hydrochloric acid or sulfuric acid, hydrochloric acid being preferred, at reflux. Another suitable method involves reacting an

appropriate w'-halo-q'-keto-q,q-dimethylphenylacetic acid compound of structure (46) with an excess of diazomethane in a suitable solvent such as ether at room temperature to 5 give the methyl ester. In addition, the ω '-halo- α '-ketoa, a-dimethylphenylacetic acid ester compound of structure (28) may also be prepared by reacting an appropriate ω' halo-a'-keto-a,a-di-methylphenylacetic acid compound of structure (46) with an excess of 2,2-dimethoxypropane in a 10 suitable solvent such as methanol at 0°C to room temperature to give the methyl ester. Another suitable method involves first reacting an appropriate ω'-halo-α'keto-α,α-dimethylphenylacetic acid compound of structure (46) with thionyl chloride in a suitable solvent such as 15 methylene chloride to give an intermediate acid chloride, followed by addition of a suitable C1 to C6 alcohol which is straight or branched. Another suitable method involves the alkylation of the carboxylate anion with an appropriate electrophile, such as dimethyl sulfate or ethyl bromide, to 20 give the corresponding ω'-halo-α'-keto-α,αdimethylphenylacetic acid ester compound of structure (31). Such methods are well known in the art and are described in J. Org. Chem., 29, 2490-2491 (1964).

Alternatively, step k and step d may be combined and the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound of structure (34) wherein n = 3 may be prepared from the corresponding cyclopropylketo-α,α-dimethylphenylacetic acid compound of structure (50).

Alternatively, step p, step k and step d may be combined and the ω' -halo- α' -keto- α , α -dimethylphenylacetic acid ester compound of structure (31) wherein n = 3 may be prepared from the corresponding cyclopropyl cyanocumylketone compound of structure (20).

35

30

In step e, the nitrile functionality of the appropriate ω -halo-cyanocumylketone compound of structure (19) is converted to the corresponding carboxy to give the ω' -halo-

 α' -keto- α , α -dimethylphenylacetic acid compound of structure (46).

For example, hydrolysis may be achieved by using a suitable acid, such as concentrated hydrochloric acid as is known in the art.

In step f, the amide functionality of the appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetic acid amide compound of structure (40) is converted to the corresponding acid by acid hydrolysis as is known in the art to give the corresponding ω'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46).

15

For example, hydrolysis may be achieved by using a suitable non-nucleophilic base, such as sodium methoxide in methanol as is known in the art. Other methods known in the art for ester cleavage include potassium carbonate in methanol, methanolic ammonia, potassium carbonate, potassium hydroxide, calcium hydroxide, sodium hydroxide, magnesium hydroxide, sodium hydroxide/pyridine in methanol, potassium cyanide in ethanoland sodium hydroxide in aqueous alcohols, with potassium hydroxide being preferred. The reaction is typically carried out in an aqueous lower alcohol solvent, such as methanol, ethanol, isopropyl alcohol, n-butanol, 2-ethoxyethanol or ethylene glycol or pyridine, at temperatures ranging from room temperature to the reflux temperature of the solvent, and the reaction time varies from about 1/2 hour to 100 hours.

In step g, the carboxy functionality of the appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46) may be amidated by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding ω'-halo-α'-keto-α,α-di-methylphenylacetic acid amide compound of structure (40).

In step h, the α-halo functionality of the appropriate ω-halo-halocumylketone compound of structure (10) is carboxylated to give the corresponding ω'-halo-α'-keto-α,α-5 dimethylphenylacetic acid compound of structure (46).

For example, a solution of the appropriate w-halohalocumylketone compound of structure (10) and a suitable catalyst, such as tetraethylammonium bromide, in a suitable 10 polar aprotic organic solvent, such as acetonitrile, N,Ndimethylacetamide, 1-methyl-2-pyrrolidinone or dimethylformamide, are placed in a jacketed glass cell and fitted with an expanded silver mesh cathode, magnesium anode and carbon dioxide delivery tube. Rotation of the 15 electrodes provides stirring, while electrical contact with the electrodes is made via spring loaded sliding carbon brushes placed against the concentric metal shafts (insulated from each other with a length of plastic tubing) onto which the electrodes are mounted. Carbon dioxide is 20 introduced into the cell at pressures of 1-10 atm, for a period of time ranging from 30 minutes to 50 hours and at a temperature range of from -30°C to 50°C. The corresponding w'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46) is isolated, after acidification with a 25 suitable mineral acid, such as hydrochloric acid, by extractive methods as are known in the art.

It is preferred that the ω -halo functionality of the appropriate ω -halo-halocumylketone compound of structure (10) for use in step h be a ω -chloro.

Alternatively, the treatment of appropriate ω-halo-halocumylketone compound of structure (10) with a transition metal catalyst such as palladium, nickel or cobalt, optionally in the presence of a phosphine catalysis using low to modest pressures of carbon monoxide as described by Stahly et al. in U.S. Patent 4,990,658, 1991

also provides the corresponding ω' -halo- α' -keto- α,α -dimethylphenylacetic acid compound of structure (46).

In step i, the appropriate the amide functionality of the appropriate ω' -halo- α' -keto- α,α -di-methylphenylacetic acid amide compound of structure (40) is converted to the corresponding ester to give the ω' -halo- α' -keto- α,α -dimethylphenylacetic acid ester compound of structure (31).

10

For example, the appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetic acid amide compound of structure (40) is reacted with an appropriate hydrogen halide in an appropriate organic solvent such as ethanol. The reaction is typically conducted at a temperature range of from room temperature to reflux and for a period of time ranging from 5 minutes to 1 hour. The ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound of structure (31) is recovered from the reaction zone by extractive methods
20 as is known in the art.

In step j, the appropriate ω'-halo-α'-keto-α,αdimethylphenylacetic acid compound of structure (46)
wherein n = 3 is ring-closed to give the corresponding
cyclopropylketo-α,α-dimethylphenylacetic acid compound of
structure (47) as described previously in Scheme A, step k.

In step k, the appropriate cyclopropylketo-\alpha,\alpha-\dimethylphenylacetic acid compound of structure (47) is

ring-opened to give the corresponding \alpha'-halo-\alpha'-keto-\alpha,\alpha-\dimethylphenylacetic acid compound of structure (46)

wherein n = 3 as described previously in Scheme A, step j.

In step 1, the nitrile functionality of the appropriate cyclopropyl cyanocumylketone compound of structure (20) is converted to the corresponding ester by reaction with an appropriate C₁ to C₆ alcohol to give the cyclopropylketo-

 α , α -dimethylphenylacetic acid ester compound of structure (32) as described previously in step a.

In step m, the nitrile functionality of the appropriate cyclopropyl cyanocumylketone compound of structure (20) is converted to the corresponding amide to give the ω' -halo- α' -keto- α,α -di-methylphenylacetic acid amide compound of structure (41) wherein R₆ and R₇ are both hydrogen as described previously in step b.

In step n, the carboxy ester functionality of the appropriate cyclopropylketo-\alpha,\alpha-dimethylphenylacetic acid ester compound of structure (32) is hydrolyzed to give the corresponding cyclopropylketo-\alpha,\alpha-dimethylphenylacetic acid compound of structure (47) as described previously in step c.

In step o, the carboxy functionality of the appropriate cyclopropylketo-\alpha,\alpha-dimethylphenylacetic acid compound of structure (47) may be esterified by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding cyclopropylketo-\alpha,\alpha-dimethylphenylacetic acid ester compound of structure (32) as described previously in step d.

In step p, the nitrile functionality of the appropriate cyclopropyl cyanocumylketone compound of structure (20) is converted to the corresponding carboxy to give the cyclopropylketo-a,a-dimethylphenylacetic acid compound of structure (47) as described previously in step e.

In step q, the amide functionality of the appropriate cyclopropylketo-\alpha,\alpha-dimethylphenylacetic acid amide

35 compound of structure (41) is converted to the corresponding acid by acid hydrolysis as is known in the art to give the corresponding cyclopropylketo-\alpha,\alpha-

dimethylphenylacetic acid compound of structure (47) as described previously in step f.

In addition, step q and step k may be combined and the w'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46) wherein n = 3 may be prepared from the corresponding cyclopropylketo-α,α-dimethylphenylacetic acid amide compound of structure (41) as described previously in Scheme A, step j.

In step r, the carboxy functionality of the appropriate cyclopropylketo-α,α-dimethylphenylacetic acid compound of structure (47) may be amidated by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding cyclopropylketo-α,α-dimethylphenylacetic acid amide compound of structure (41) as described previously in step q.

In step s, the α-halo functionality of the appropriate cyclopropyl halocumylketone compound of structure (11) is carboxylated to give the corresponding cyclopropylketo-α,α-dimethylphenylacetic acid compound of structure (47) as described previously in step h.

25

In step t, the appropriate the amide functionality of the appropriate cyclopropylketo- α,α -dimethylphenylacetic acid amide compound of structure (41) is converted to the corresponding ester to give the cyclopropylketo- α,α -dimethylphenylacetic acid ester compound of structure (32) as described previously in step i.

In step u, the nitrile functionality of the appropriate ω -halo-cyanoethylphenylketone compound of structure (21) is converted to the corresponding ester by reaction with an appropriate C_1 to C_6 alcohol to give the ω '-halo- α '-keto- α -methylphenylacetic acid ester compound of structure (33) as described previously in step a.

In step v, the nitrile functionality of the appropriate ω-halo-cyanoethylphenylketone compound of structure (21) is converted to the corresponding amide to give the ω'-halo
α'-keto-α-methylphenylacetic acid amide compound of structure (42) wherein R₆ and R₇ are both hydrogen as described previously in step b.

In step w, the carboxy ester functionality of the

10 appropriate ω'-halo-α'-keto-α-methylphenylacetic acid ester compound of structure (33) is hydrolyzed to give the corresponding ω'-halo-α'-keto-α-methylphenylacetic acid compound of structure (48) as described previously in step c.

15

In step x, the carboxy functionality of the appropriate ω'-halo-α'-keto-α-methylphenylacetic acid compound of structure (48) may be esterified by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding ω'-halo-α'-keto-α-methylphenylacetic acid ester compound of structure (33) as described previously in step d.

Alternatively, step ee and step x may be combined and the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound of structure (33) wherein n = 3 may be prepared from the corresponding cyclopropylketo-α-methylphenylacetic acid compound of structure (49) as described previously in step d.

30

Alternatively, step jj, step ee and step x may be combined and the ω '-halo- α '-keto- α , α -dimethylphenylacetic acid ester compound of structure (33) wherein n=3 may be prepared from the corresponding cyclopropyl cyanoethylphenylketone compound of structure (23) as

described previously in step d.

25

30

35

In step y, the nitrile functionality of the appropriate ω-halo-cyanoethylphenylketone compound of structure (21) is converted to the corresponding carboxy to give the ω'-halo-5 α'-keto-α-methylphenylacetic acid compound of structure (48) as described previously in step e.

In step z, the amide functionality of the appropriate ω'-halo-α'-keto-α-methylphenylacetic acid amide compound of structure (42) is converted to the corresponding acid by acid hydrolysis as is known in the art to give the ω'-halo-α'-keto-α-methylphenylacetic acid compound of structure (48) as described previously in step f.

In step aa, the carboxy functionality of the appropriate w'-halo-α'-keto-α-methylphenylacetic acid compound of structure (48) may be amidated by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding w'-halo-α'-keto-α-methylphenylacetic acid amide compound of structure (42) as described previously in step g.

In step bb, the α -halo functionality of the appropriate ω -halo-haloethylphenylketone compound of structure (12) is carboxylated to give the corresponding ω '-halo- α '-keto- α -methylphenylacetic acid compound of structure (48) as described previously in step h.

In step cc, the appropriate the amide functionality of the appropriate ω' -halo- α' -keto- α -methylphenylacetic acid amide compound of structure (42) is converted to the corresponding ester to give the ω' -halo- α' -keto- α -methylphenylacetic acid ester compound of structure (33) as described previously in step i.

In step dd, the appropriate ω' -halo- α' -keto- α methylphenylacetic acid compound of structure (48) wherein n=3 is ring-closed to give the corresponding

cyclopropylketo-a-methylphenylacetic acid compound of structure (49) as described previously in Scheme A, step k.

5 In step ee, the appropriate cyclopropylketo-α-methylphenylacetic acid compound of structure (49) is ring-opened to give the corresponding ω'-halo-α'-keto-α-methylphenylacetic acid compound of structure (48) wherein n = 3 as described previously in Scheme A, step j.

10

In step ff, the nitrile functionality of the appropriate cyclopropyl cyanoethylphenylketone compound of structure (23) is converted to the corresponding ester by reaction with an appropriate C₁ to C₆ alcohol to give the cyclopropylketo-a-methylphenylacetic acid ester compound of structure (35) as described previously in step a.

In step gg, the nitrile functionality of the appropriate cyclopropyl cyanoethylphenylketone compound of structure (23) is converted to the corresponding amide to give the cyclopropylketo-a-methylphenylacetic acid amide compound of structure (44) wherein R₆ and R₇ are both hydrogen as described previously in step b.

In step hh, the carboxy ester functionality of the appropriate cyclopropylketo-α-methylphenylacetic acid ester compound of structure (35) is hydrolyzed to give the corresponding cyclopropylketo-α-methylphenylacetic acid compound of structure (49) as described previously in step 30 c.

In step ii, the carboxy functionality of the appropriate cyclopropylketo-a-methylphenylacetic acid compound of structure (49) may be esterified by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding cyclopropylketo-a-methylphenylacetic acid ester compound of structure (35) as described previously in step d.

35

In step jj, the nitrile functionality of the appropriate cyclopropyl cyanoethylphenylketone compound of structure (23) is converted to the corresponding carboxy to give the cyclopropylketo-a-methylphenylacetic acid compound of structure (49) as described previously in step e.

In step kk, the amide functionality of the appropriate cyclopropylketo-α-methylphenylacetic acid amide compound of structure (44) is converted to the corresponding acid by acid hydrolysis as is known in the art to give the corresponding cyclopropylketo-α-methylphenylacetic acid compound of structure (49) as described previously in step f.

In addition, step kk and step ee may be combined and the ω'-halo-α'-keto-α-methylphenylacetic acid compound of structure (48) wherein n = 3 may be prepared from the corresponding cyclopropylketo-α-methylphenylacetic acid amide compound of structure (44) as described previously in Scheme A, step j.

In step 11, the carboxy functionality of the

25 appropriate cyclopropylketo-a-methylphenylacetic acid
compound of structure (49) may be amidated by techniques
and procedures well known and appreciated by one of
ordinary skill in the art to give the corresponding
cyclopropylketo-a-methylphenylacetic acid amide compound of
30 structure (44) as described previously in step g.

In step mm, the α -halo functionality of the appropriate cyclopropyl haloethylphenylketone compound of structure (14) is carboxylated to give the corresponding cyclopropylketo- α -methylphenylacetic acid compound of structure (49) as described previously in step h.

In step nn, the appropriate the amide functionality of the appropriate ω' -halo- α' -keto- α -methylphenylacetic acid

amide compound of structure (42) is converted to the corresponding ester to give the ω '-halo- α '-keto- α -methylphenylacetic acid ester compound of structure (33) as described previously in step i.

In step oo, the nitrile functionality of the appropriate ω-halo cyanotolylketone compound of structure (22) is converted to the corresponding ester by reaction with an appropriate C₁ to C₆ alcohol to give the ω'-halo-α'-keto-phenylacetic acid ester compound of structure (34) as described previously in step a.

In step pp, the nitrile functionality of the appropriate ω -halo cyanotolylketone compound of structure (22) is converted to the corresponding amide to give the ω' -halo- α' -keto-phenylacetic acid amide compound of structure (43) wherein R_6 and R_7 are both hydrogen as described previously in step b.

20

In step qq, the carboxy ester functionality of the appropriate ω'-halo-α'-keto-phenylacetic acid ester compound of structure (34) is hydrolyzed to give the corresponding ω'-halo-α'-keto-methylphenylacetic acid compound of structure (50) as described previously in step c.

In step rr, the carboxy functionality of the appropriate ω'-halo-α'-keto-methylphenylacetic acid
compound of structure (50) may be esterified by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding ω'-halo-α'-keto-phenylacetic acid ester compound of structure (34) as described previously in step d.

35

Alternatively, step yy and step rr may be combined and the ω '-halo- α '-keto-phenylacetic acid ester compound of structure (34) wherein n = 3 may be prepared from the

corresponding ω' -halo- α' -keto-methylphenylacetic acid compound of structure (50) as described previously in step d.

5

Alternatively, step ddd, step yy and step rr may be combined the ω'-halo-α'-keto-phenylacetic acid ester compound of structure (34) wherein n = 3 may be prepared from the corresponding cyclopropyl cyanotolylketone

10 compound of structure (24) as described previously in step d.

In step ss, the nitrile functionality of the appropriate ω-halo cyanotolylketone compound of structure 15 (22) is converted to the corresponding carboxy to give the ω'-halo-α'-keto-methylphenylacetic acid compound of structure (50) as described previously in step e.

In step tt, the amide functionality of the appropriate ω'-halo-α'-keto-phenylacetic acid amide compound of structure (43) is converted to the corresponding acid by acid hydrolysis as is known in the art to give the ω'-halo-α'-keto-methylphenylacetic acid compound of structure (50) as described previously in step f.

25

In step uu, the carboxy functionality of the appropriate ω'-halo-α'-keto-methylphenylacetic acid compound of structure (50) may be amidated by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding ω'-halo-α'-keto-phenylacetic acid amide compound of structure (43) as described previously in step g.

In step vv, the α-halo functionality of the appropriate 35 ω-halo halotolylketone compound of structure (13) is carboxylated to give the corresponding ω'-halo-α'-keto-methylphenylacetic acid compound of structure (50) as described previously in step h.

15

20

30

35

In step ww, the appropriate the amide functionality of the appropriate w'-halo-α'-keto-phenylacetic acid amide compound of structure (43) is converted to the corresponding ester to give the ω'-halo-α'-keto-phenylacetic acid ester compound of structure (34) as described previously in step i.

In step xx, the appropriate ω'-halo-α'-keto-methylphenylacetic acid compound of structure (50) wherein n = 3 is ring-closed to give the corresponding cyclopropylketo-phenylacetic acid compound of structure (51) as described previously in Scheme A, step k.

In step yy, the appropriate cyclopropylketophenylacetic acid compound of structure (51) is ring-opened to give the corresponding ω' -halo- α' -ketomethylphenylacetic acid compound of structure (50) wherein n=3 as described previously in Scheme A, step j.

In step zz, the nitrile functionality of the appropriate cyclopropyl cyanotolylketone compound of structure (24) is converted to the corresponding ester by reaction with an appropriate C₁ to C₆ alcohol to give the cyclopropylketo-phenylacetic acid ester compound of structure (36) as described previously in step a.

In step aaa, the nitrile functionality of the appropriate cyclopropyl cyanotolylketone compound of structure (24) is converted to the corresponding amide to give the cyclopropylketo-phenylacetic acid amide compound of structure (45) wherein R_6 and R_7 are both hydrogen as described previously in step b.

In step bbb, the carboxy ester functionality of the appropriate cyclopropylketo-phenylacetic acid ester compound of structure (36) is hydrolyzed to give the

corresponding cyclopropylketo-phenylacetic acid compound of structure (51) as described previously in step c.

In step ccc, the carboxy functionality of the appropriate cyclopropylketo-phenylacetic acid compound of structure (51) may be esterified by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding cyclopropylketo-phenylacetic acid ester compound of structure (36) as described previously in step d.

In step ddd, the nitrile functionality of the appropriate cyclopropyl cyanotolylketone compound of structure (24) is converted to the corresponding carboxy to give the cyclopropylketo-phenylacetic acid compound of structure (51) as described previously in step e.

In step eee, the amide functionality of the appropriate cyclopropylketo-phenylacetic acid amide compound of structure (45) is converted to the corresponding acid by acid hydrolysis as is known in the art to give the corresponding cyclopropylketo-phenylacetic acid compound of structure (51) as described previously in step f.

25

In addition, step yy and step eee may be combined and the ω'-halo-α'-keto-methylphenylacetic acid compound of structure (50) wherein n = 3 may be prepared from the corresponding cyclopropylketo-phenylacetic acid amide compound of structure (45) as described previously in Scheme A, step j.

In step fff, the carboxy functionality of the appropriate cyclopropylketo-phenylacetic acid compound of structure (51) may be amidated by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding cyclopropylketo-phenylacetic

5

acid amide compound of structure (45) as described previously in step g.

In step ggg, the α -halo functionality of the appropriate cyclopropyl halotolylketone of structure (15) is carboxylated to give the corresponding cyclopropylketo-phenylacetic acid compound of structure (51) as described previously in step h.

In step hhh, the appropriate the amide functionality of the appropriate cyclopropylketo-phenylacetic acid amide compound of structure (45) is converted to the corresponding ester to give the cyclopropylketo
phenylacetic acid ester compound of structure (36) as described previously in step i.

Starting materials for use in Scheme H are readily available to one of ordinary skill in the art.

The following examples present typical syntheses as described in Scheme H. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "pL" refers to microliters; "pg" refers to micrograms; and "pM" refers to micromolar.

Example 24

Step a: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, methyl ester

Place anhydrous methanol (5mL) under argon, cool to 0°C and add hydrogen chloride until saturated. Add 2-[4-(4-chlorobutyryl)-phenyl]-2-methyl-propionitrile (103mg, 4.12mmol), remove the ice bath and stir for 5 hours at room temperature. Allow to stand at -10°C overnight, and stir

an additional 3 hours at room temperature. Pour into cracked ice (20g) and allow to stand for 5 minutes. Evaporate the solvent in vacuo to 1/2 volume, dilute with 5 water and extract with methylene chloride (3X). Combine the organic layers, wash with saturated sodium hydrogen carbonate and brine. Dry (MgSO₄), filter and evaporate the solvent in vacuo. Extract the residue into hot hexane (12mL), filter hot and evaporate the solvent in vacuo to give the title comound as a colorless oil (97mg, 83%).

Example 25

Step d: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, ethyl ester

15 Add anhydrous hydrogen chloride gas (18.0g) to anhydrous ethanol DB (210g) by purging the solution. Add this hot solution (60°C) to a solution of 2-[4-(4-chloro-butyryl)-phenyl]-2-methyl-propionic acid (31g, 115.6mmol) and reflux under a nitrogen atmosphere for 2.5 hours. Evaporate the solvent in vacuo, dissolve the residue in methylene chloride (150mL) and wash with water (2X100mL). Dry (MgSO₄), filter through silica gel, washing the gel with methylene chloride (250mL). Combine the organic washings and evaporate the solvent in vacuo to give the title compound as a colorless oil (33.3q, 97%).

1H NMR (300MHz, CDCl₃) δ 7.96 (d, J=8.3Hz, 2H), 7.45 (d,
J=8.3Hz, 2H), 4.15 (q, J=7.1Hz, 2H), 3.70 (t, J=6.6Hz, 2H),
3.19 (t, J=6.8Hz, 2H), 2.25 (p, J=6.6Hz, 2H), 1.61 (s, 6H),
30 1.20 (q, J=7.1Hz, 3H); ¹³C NMR (75 MHz, CDCl₃) δ 198.4,
176.0, 150.3, 135.1, 128.1, 126.0, 61.0, 46.8, 44.6, 35.2,
26.7, 26.3, 14.0; IR (neat) 2978, 1728, 1686, 1606, 1254,
1231, 1148, 1097 cm⁻¹.

35 Anal. Calcd for C₁₆H₂₁O₃Cl: C, 64.75; H, 7.13; Found: C, 64.24; H, 7.18.

Example 26

Step d: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic
acid, methyl ester

- Dissolve 2-[4-(4-chloro-butyryl)-phenyl]-2-methyl-propionic 5 acid (6.2g, 23.1mmol) in hot methanolic solution of anhydrous hydrogen chloride (42mL of a methanol containing 3.2g of anhydrous hydrogen chloride). Reflux for 42 minutes, evaporate the solvent *invacuo*, dissolve the residue in methylene chloride and wash with water. Dry (MgSO₄),
- 10 filter through silica gel, washing the gel with methylene chloride. Combine the organic washings and evaporate the solvent *invacuo* to give the title compound as a clear oil (6.21g, 94%).

Found: C, 63.50; H, 6.67.

Example 27

25 Step d: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid, methyl ester

Mix 2-[4-(4-chloro-butyryl)-phenyl]-2-methyl-propionic acid (10.0g, 37.3mmol) and anhydrous potassium carbonate (3.5g, 25.3mmol). Heat to 40°C in acetonitrile (100mL) and stir

- under a nitrogen atmosphere. Add dimethyl sulfate (13.3g, 105mmol) and reflux for 45 minutes. Evaporate the solvent in vacuo, dissolve the residue in ethyl acetate (50mL) and wash with water (4X50mL). Dry (MgSO₄), filter through silica gel and evaporate the solvent in vacuo to give the
- 35 title compound (6.4g, 89%).

Example 28

Step h: 2-[4-(4-Chloro-butyryl)-phenvl]-2-methyl-propionic acid

Fit a jacketed glass cell of about 6L capacity with a 5 rotating expanded silver mesh cathode/magnesium anode assembly, a carbon dioxide delivery tube, and a stainless steel thermocouple. Load the cell with acetonitrile (5.8L) and tetraethylammonium bromide (26g). Sparge with carbon dioxide and cool in cooling bath. When the contents of the 10 cell reach -10°C, add hydrogen chloride remediated 1-[4-(1bromo-1-methyl-ethyl)-phenyl]-4-chloro-butan-1-one and 1-[4-(1-chloro-l-methyl-ethyl)-phenyl]-4-chloro-butan-l-one (424.9g, 53.5 mole % bromo and 20.4 mole % chloro by HPLC analysis, 1087 mmol total active tertiary benzylic halide) 15 and perform electrolysis at a controlled current of 8 amps (20 mA cm-2) for 6 hours. Drain the contents, acidify with chilled aqueous 6M hydrochloric acid, extract, evaporate the solvent in vacuo and recrystallize to give the title compound (186g, 64%); 78.5-80.3°C.

30

Example 29

Step h: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic
acid

Fit a jacketed glass cell of about 50mL capacity with an expanded silver mesh cathode (14 cm² geometric area), a roughly concentric magnesium sacrificial anode, a tube to deliver carbon dioxide gas and a magnetic stir bar. Add a solution of hydrogen chloride remediated 1-[4-(1-bromo-1-

methyl-ethyl)-phenyl]-4-chloro-butan-l-one and l-[4-(1-chloro-l-methyl-ethyl)-phenyl]-4-chloro-butan-l-one (2.79g, 89 mole %, 3:1 ratio of tertiary benzylic bromide to tertiary benzylic chloride by NMR, approximately 8.6mmol total active tertiary benzylic halide) in acetonitrile (45mL) and tetraethylammonium bromide (0.19g). Close the cell and cool to -10°C with a continuous carbon dioxide sparge for 169 minutes at an average current density of 13 mA cm⁻². Warm to contents of the cell to ambient temperature, drain the contents, acidify with chilled aqueous 6M hydrochloric acid, extract and evaporate the solvent in vacuo to give the title compound (1.53g, 66%).

15 Example 30

Step h: 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid

Pit a jacketed glass cell of 50mL capacity with an expanded silver mesh cathode (14 cm2 geometric area), a roughly concentric magnesium sacrificial anode, a tube to deliver carbon dioxide gas, and a magnetic stir bar. Cool the cell to -10°C under carbon dioxide. Add a solution of tetraethylammonium chloride (40mL of a 0.02M solution in dimethylformamide) and 1-[4-(1-chloro-1-methyl-ethyl)
25 phenyl]-4-chloro-butan-1-one (2.91g, 85% pure by NMR, 9.81mmol) and carry out electrolysis for 178 minutes at an average current density of 12.4 mA cm-2: the total charge passed is equal to 98% of the calculated theoretical two electron value. Warm the contents of the cell to ambient temperature, drain the contents, acidify with chilled aqueous 6M hydrochloric acid, extract and evaporate the solvent invacuo to give the title compound (1.89g, 72%).

Example 31

35 Step m: 2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl-propionamide

Dissolve 2-(4-cyclopropanecarbonyl-phenyl)-2-methyl-propionitrile (100mg) in aqueous ethanolic potassium

hydroxide (2mL) (prepared from ethanol (5mL), water (5mL) and solid potassium hydroxide (1.5g). Stir overnight at room temperature, then heat at reflux for 6 hours. Cool and evaporate the solvent *in vacuo* to give the title compound.

Example 32

Step t: 2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl-

10 propionic acid, ethyl ester

Dissolve 2-(4-cyclopropanecarbonyl-phenyl)-2-methylpropionamide (100mg) in ethanol and bubble in hydrochloride gas for 5 minutes while stirring. Reflux for 10 hours, distill off the ethanol and extract into ethyl acetate.

15 Evaporate the solvent *in vacuo* to give the title compound as an oil (50mg).

Example 33

Step k and step q: 2-[4-(4-Bromo-butyryl)-phenyl]-2-methyl20 propionic acid

Treat 2-(4-cyclopropanecarbonyl-phenyl)-2-methyl-N-methyl-N-methoxy-propionamide (0.15g, 0.53mmol) with 48% HBr (lmL) for 2 hours at 80°C. Cool to room temperature, dilute with water (5mL) and neutralize with aqueous sodium hydrogen carbonate until pH 7. Extract with methylene chloride (3X15mL), dry (Na₂SO₄), filter and evaporate the solvent in vacuo. Purify by silica gel chromatography (3:1 hexane/ethyl acetate) to give the title compound (0.15g, 95%).

30

1H NMR (CDCl₃) δ 7.97 (d, 2H), 7.51 (d, 2H), 3.53 (t, 2H), 3.16 (t, 2H), 2.30 (quin, 2H), 1.60 (s, 6H); 13C NMR (CDCl₃) δ 198.4, 181.8, 149.5, 131.0, 128.3, 126.3, 46.6, 36.5, 33.6, 26.9, 26.1; MS (CI) (M*+H) 303 (100), 315 (98), 233 (80).

Example 34

Step p: 2-(4-Cyclopropanecarbonyl-phenyl)-2-methylpropionic acid

Combine 2-(4-cyclopropanecarbonyl-phenyl)-2-methyl
5 propionitrile (0.5g) in 12.5% sodium hydroxide (20mL) and ethanol (12.5mL). Heat to reflux for 21 hours, cool and remove the ethanol by vacuum distillation. Extract the residual aqueous suspension with methylene chloride (40mL), acidify the aqueous phase with 20% HCl and extract with methylene chloride (2X40mL). Combine the organic phases, dry (Na₂SO₄) and evaporate the solvent invacuo to give the title compound as a crystalline solid (350mg, 70%); mp 83-

15 ¹H NMR (CDCl₃) δ 7.50-8.00 (4H, d), 2.66 (1H, m), 1.62 (6H, s), 1.24 (2H, m), 1.04 (2H, m).

The following compounds can be prepared by using the procedures depicted in Scheme H:

20

85°C.

- (4-Cyclopropanecarbonyl-phenyl)-acetic acid;
- 2-(4-Cyclopropanecarbonyl-phenyl)-propionic acid;
- 25 2-(4-Cyclopropanecarbonyl-phenyl)-2-methyl-propionic acid;
 - [4-(4-Chloro-butyryl)-phenyl]-acetic acid;
 - 2-[4-(4-Chloro-butyryl)-phenyl]-propionic acid;

30

- 2-[4-(4-Chloro-butyryl)-phenyl]-2-methyl-propionic acid;
- (4-Cyclopropanecarbonyl-phenyl)-acetic acid, ethyl ester;

 a_1

 $D' = -C(=0)CH_3 \text{ or } -C(=0)C_6H_5$

Scheme I provides a general synthetic procedure for preparing the novel intermediate of formula (II) wherein R_5 is COOH.

5

In step a, the neophyl acetate of benzoate of structure (53) is acylated with an appropriate ω -halo compound of the structure Hal-(CH₂)_n-C(=O)-B, wherein B is Hal or hydroxy, Hal is Cl. Br or I and n is as previously defined to give the corresponding ω' -halo- α' -keto-(2-methylpropanol)benzene acetate or benzoate compound of structure (54) as described previously in Scheme A, step d.

The neophyl acetate of benzoate of structure (53) is prepared by reacting a methallyl halide of structure

20

wherein Hal is Cl, Br or I with sodium acetate or sodium benzoate in a suitable organic solvent such as 1-methyl-2-pyrrolidinone. The reactants are heated at a temperature of approximately 100 to 130°C and the corresponding to give the methallyl acetate or benzoate of structure

30

wherein D' is $-C(=0)CH_3$ or $-C(=0)C_6H_5$ which is collected by distillation.

35

A benzene compound of structure

 \bigcirc

5

wherein A is defined above is then alkylated with the methylallyl acetate or benzoate of structure

10

wherein D' is -C(=0)CH₃ or -C(=0)C₆H₅

to give the neophyl acetate or benzoate of structure (53)
as described previously in Scheme A, step d.

In step a2, the neophyl acetate or benzoate of structure (53) is acylated with an appropriate cyclopropyl compound of the structure

25

wherein B is as previously defined to give the corresponding cyclopropyl neophyl acetate or benzoate of structure (55) as described previously in Scheme A, step e.

30

In step b₁, the appropriate ω '-halo- α '-keto-(2-methylpropanol)benzene acetate or benzoate compound of structure (54) wherein n = 3 is ring-closed to give the corresponding cyclopropyl neophyl acetate or benzoate of structure (55) as described previously in Scheme A, step k.

35

In step b_2 , the appropriate cyclopropyl neophyl acetate or benzoate of structure (55) is ring-opened to give the corresponding ω' -halo- α' -keto-(2-methylpropanol)benzene

acetate or benzoate compound of structure (54) wherein n = 3 as described previously in Scheme H, step j.

In step c₁, the acetate or benzoate functionality of the appropriate ω'-halo-α'-keto-(2-methylpropanol)benzene acetate or benzoate compound of structure (54) is hydrolyzed with concentrated hydrochloric acid in ethanol at reflux temperature for a period of time ranging from 1-10 hours. The corresponding ω'-halo-α'-keto-(2-methylpropanol)benzene compound of structure (56) is recovered from the reaction zone by extractive methods as is known in the art.

15 In step c₂, the appropriate ω'-halo-α'-keto-(2-methylpropanol)benzene acetate or benzoate compound of structure (54) wherein n = 3 is ring closed and the acetate or benzoate functionality hydrolyzed with base to give the cyclopropyl neophyl alcohol compound of structure (57).

20

For example, the appropriate ω'-halo-α'-keto-(2-methylpropanol)benzene acetate or benzoate compound of structure (54) wherein n = 3 is reacted with 40% ageuous tetrabutylammonium hydroxide and 50% ageuous sodium hydroxide at reflux temperature for a period of time ranging from 5-72 hours. The cyclopropyl neophyl alcohol compound of structure (57) may be recovered from the reaction zone by extractive methods as are known in the art.

30

In step c_3 , the acetate or benzoate functionality of the appropriate cyclopropyl neophyl acetate or benzoate of structure (55) is hydrolyzed to give the corresponding cyclopropyl neophyl alcohol of structure (57).

35

For example, the appropriate cyclopropyl neophyl acetate or benzoate of structure (55) is reacted with 50% aqueous sodium hydroxide at reflux temperature for a period

of time ranging from 5 minutes to 5 hours. The corresponding cyclopropyl neophyl alcohol of structure (57) is recovered from the reaction zone by extractive methods 5 as are known in the art.

In step d₁, the ω'-halo-α'-keto-(2methylpropanol)benzene acetate or benzoate compound of
structure (54) is converted to the corresponding ω'-halo10 α'-keto-α,α-dimethylphenylacetic acid compound of structure
(46).

For example, the appropriate cyclopropyl neophyl alcohol of structure (54) may be reacted with ruthenium chloride/sodium periodate in a suitable organic solvent such as acetonitrile and/or carbon tetrachloride, ruthenium chloride/sodium hypochloride in a suitable solvent such as acetic acid/water, potassium permanganate in a suitable solvent such as acetic acid/water, fumic nitric acid in acetic acid or sodium nitrite/concentrated nitric acid in acetic acid. The reactants are typically mixed stirred together at a temperature range of 10°C to 50°C and for a period of time ranging from 30 minutes to 10 hours. The corresponding cyclopropylketo-a,a-dimethylphenylacetic acid compound of structure (46) is recovered from the reaction zone by extractive methods as is known in the art.

In step d₂, the ω'-halo-α'-keto-(2methylpropanol)benzene compound of structure (56) is
converted to the corresponding ω'-halo-α'-keto-α,αdimethylphenylacetic acid compound of structure (46).

For example, the appropriate ω'-halo-α'-keto-(2-methylpropanol)benzene compound of structure (56) may be oxidized with potassium permanganate in suitable acid solvent such as acetic acid. The reactants are typically reacted at a temperature range of from about 0°C to 5°C for a period of time ranging from 30 minutes to 10 hours.

The corresponding ω'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46) is recovered from the reaction zone by extractive methods as are known in the art and may be purified by recrystallization. Other oxidizing reagents suitable for the oxidation of the appropriate ω'-halo-α'-keto-(2-methylpropanol)benzene compound of structure (56) to the corresponding ω'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46) are nitric acid, chromium (IV) oxide, nitrogen dioxide, ruthenium (VIII) oxide, nickel peroxide, silver oxide, t-butyl chromate, xenic acid

In step d₃, the hydroxymethyl functionality of the

15 appropriate w'-halo-a'-keto-(2-methylpropanol)benzene
compound of structure (56) is oxidized with a variety of
oxidizing agents and methods to give the corresponding w'halo-a'-keto-a,a-dimethylphenylacetaldehyde compound of
structure (58).

20

One such method involves a procedure in which the hydroymethyl functionality of the appropriate w'-halo-a'keto-(2-methylpropanol)benzene compound of structure (56) is oxidized to the corresponding aldehyde functionality 25 using, for example, Swern Oxidation conditions (dimethyl sulfoxide, oxalyl chloride and triethylamine), as is known in the art. The Swern Oxidation is carried out in a suitable aprotic organic solvent such as methylene chloride at temperatures ranging from about -78°C to room 30 temperature, and the reaction time vaires from about 1/2 hours to 8 hours. Other suitable reagents for the oxidation of the hydroxyethyl functionality of the appropriate w'-halo-q'-keto-(2-methylpropanol)benzene compound of structure (56) to the corresponding w'-halo-a'- ' 35 keto-α,α-dimethylphenylacetaldehyde compound of structure (58) are Dess-Martin reagent, chromium (IV) oxide, nickel peroxide, sodium dichromate, potassium dichromate, t-butyl chromate, silver oxide, argentic picolinate, manganese

dioxide, lead tetraacetate, dicyclohexylcarbodiimide, 2,3-dichloro-5,6-dicyanoquinone, tetrachloro-1,2-benzoquinone, 2,2,6,6-tetramethylpiperidinyl-l-oxy (TEMPO) or quinolinium 5 chlorochromate.

In step d₄, the hydroxymethyl functionality of the appropriate cyclopropyl neophyl alcohol of structure (57) is oxidized to give the corresponding cyclopropylketo-α,α-10 dimethylphenylacetaldehyde compound of structure (59) as described previously in step d₃.

In step d₅, the appropriate cyclopropyl neophyl alcohol of structure (57) is converted to the corresponding cyclopropylketo-q,q-dimethylphenylacetic acid compound of structure (47) as described previously in step d₂.

In step d_6 , the appropriate cyclopropyl neophyl acetate or benzoate of structure (55) is converted to the corresponding cyclopropylketo- α , α -dimethylphenylacetic acid compound of structure (47) as described previously in step d_1 .

In step e₁, the appropriate ω'-halo-α'-keto-(225 methylpropanol)benzene compound of structure (56) wherein n
= 3 is ring-closed to give the corresponding cyclopropyl
neophyl alcohol of structure (57) as described previously
in Scheme H, step j.

In step e₂, the appropriate cyclopropyl neophyl alcohol of structure (57) is ring-opened to give the corresponding ω'-halo-α'-keto-(2-methylpropanol)benzene compound of structure (56) wherein n = 3 as described previously in Scheme H, step k.

35

In step f_1 , the appropriate ω' -halo- α' -keto- α,α -dimethylphenylacetaldehyde compound of structure (58) wherein n=3 is ring-closed to give the corresponding

cyclopropylketo-a,a-dimethylphenylacetaldehyde compound of structure (59) as described previously in Scheme H, step j.

In step f₂, the appropriate cyclopropylketo- α , α -dimethylphenylacetaldehyde compound of structure (59) is ring-opened to give the corresponding ω '-halo- α '-keto- α , α -dimethylphenylacetaldehyde compound of structure (58) wherein n = 3 as described previously in Scheme H, step k.

10

In step g₁, the aldehyde functionality of the appropriate ω' -halo- α' -keto- α , α -dimethylphenylacetaldehyde compound of structure (58) is oxidized to give the corresponding ω' -halo- α' -keto- α , α -dimethylphenylacetic acid compound of structure (46).

For example, the appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetaldehyde compound of structure (58) is reacted with, for example, potassium permanganate. The potassium permanganate oxidation is carried out in a suitable acidic medium such as hydrochloric acid/acetone at a temperature ranging from about 0°C to room temperature and the reaction time varies from about 1/2 hour to 8 hours. Other suitable reageants for the oxidation of the ω'-halo-α'-keto-α,α-dimethylphenylacetaldehyde compound of structure (58) to the corresponding ω'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46) are chromium (IV) oxide, silver (I) oxide, silver oxide, argentic picolinate, peroxide, nitric acid, m-30 chloroperbenzoic acid and peracetic acid.

In step g₂, the aldehyde functionality of the appropriate cyclopropylketo-α,α-dimethylphenylacetaldehyde compound of structure (59) is oxidized to give the corresponding cyclopropylketo-α,α-dimethylphenylacetic acid compound of structure (47) as described previously in step g₁.

Starting materials for use in Scheme I are readily available to one of ordinary skill in the art.

The following examples present typical syntheses as described in Scheme I. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "µL" refers to microliters; "µg" refers to micrograms; and "µM" refers to micromolar.

15

Example 35

Step a₁: 2-(4-(4-Chloro-1-oxo-butyl))-phenyl-2-methyl
propanyl acetate

20 Mix 1-methyl-2-pyrrolidinone (400mL), sodium acetate (205g, 2.5mol), stir at heat to 100°C in a reaction flask which is fitted with a distillation head. Add, by dropwise addition, methylallyl chloride (181g, 2.0mol) over 1 hour. Heat the pot to 120°C for 30 minutes collect methallyl acetate by distillation (193g).

Mix methallyl acetate (228g, 2.0mol) and benzene (1L) and cool to 5°C. Add aluminum chloride (266g, 2.0mol) over approximately 30 minutes while maintaining the temperature below 10°C. Add, in portions of 50mL to 80mL each, to a 5°C mixture of aluminum chloride (15g) in benzene (600mL). After addition is complete, stir at 0-3°C for 1/2 hour, pour onto ice (2kg) and separate the organic layer. Wash with water (2X300mL), dry (Na₂SO₄), and distill to give 35 neophyl acetate.

Dissolve neophyl acetate (150g, 0.78mol) in methylene chloride (390mL) and cool to 5°C. Add anhydrous aluminum

chloride (104g, 0.78mol) at such a rate that the temperature is maintained below 10°C. Cool the reaction mixture to 5°C. Dissolve anhydrous aluminum chloride

5 (122g) in methylene chloride (390mL) and cool to 5°C. Add 4-chlorobutyryl chloride (132g, 0.94mol) at such a rate that the temperature is kept below 10°C. Cool the reaction to 5°C and add the neophyl acetate-aluminum chloride solution in one portion and stir between -5°C and 5°C for 19 hours. Pour slowly over crushed ice (1.5kg), separate the organic phase and wash with water (3X300mL), cold aqueous potassium carbonate (10%, 300mL) and water (300mL). Evaporate the solvent invacuo and filter to give the title compound as a light-brown oil (221.1g, 95.6%).

15

¹H NMR (300MHz, CDCl₃) δ 1.34 (6H, s), 1.95 (3H, s), 2.18 (2H, quent.), 3.13 (2H, t), 3.65 (2H, t), 4.12 (2H, s), 7.43, 7.90 (2H each, d).

20

Example 36

Step b₁: 2-(4-(1-0xo-1-cyclopropanyl)-phenyl-2-methylpropanyl acetate

Mix 2-(4-(4-chloro-l-oxo-butyl))-phenyl-2-methyl propanyl
acetate (37.0g, 0.125mol), tetrabutylammonium hydroxide
(8.1g of a 40% aqueous solution), methylene chloride
(300mL) and 50% sodium hydroxide (40mL). Stir vigorously
at room temperature for 4 hours, add water (100mL) and
separate the organic layer. Wash with water (2X100mL), dry
(MgSO₄) and evaporate the solvent invacuo to give the title
compound (29.9g).

¹H NMR (300MHz, CDCl₃) δ 1.00, 1.19 (2H each, m), 1.34 (6H, s), 1.95 (3H, s), 2.65 (1H, m), 4.13 (2H, s), 7.44, 7.95 (2H each, d).

Example 37

Step c1: 2-(4-(4-Chloro-1-oxobutyl)-phenyl-2-methylpropanol
Mix 2-(4-(4-chloro-1-oxo-butyl))-phenyl-2-methyl propanyl
acetate, concentrated hydrochloric acid (555mL), and
5 ethanol (2.5L) and reflux for 2.5 hours under a nitrogen
atmosphere. Evaporate the solvent in vacuo and take the
residue up in methylene chloride (1L). Wash sequentially
with water (2X400mL), aqueous potassium carbonate (10%,
200mL) and water (300mL). Evaporate the solvent in vacuo to
10 give the title compound as a light-brown oil (200g, 90%).

1H NMR (300MHz, CDCl₃) δ 1.35 (6H, s), 2.21 (2H, quent.) 3.15, (2H, t), 3.64 (2H, s), 3.66 (2H, 5), 7.48, 7.93 (2H each, d).

15

Example 38

Step c₂: 2-(4-(1-0xo-1-cyclopropanyl))-phenyl-2-methylpropanol

Mix 2-(4-(4-chloro-1-oxobutyl)-phenyl-2-methylpropanol (10lg, 0.34mol), methylene chloride (800mL), 40% aqueous solution of tetrabutylammonium hydroxide (33g), and 50% aqueous solution of sodium hydroxide (162mL) and reflux for 48 hours. Add water (300mL), separate the organic phase and wash with water (2X300mL). Dry (MgSO₄) and evaporate the solvent in vacuo to give the title compound as a light-brown oil (71.lg, 96%).

Example 39

30

Step c3: 2-(4-(1-0xo-1-cyclopropanyl))-phenyl-2-methylpropanol

Mix 2-(4-(1-oxo-1-cyclopropany1))-phenyl-2-methylpropanyl acetate (4.16g, 14mmol), ethanol (50mL) and water (5mL).

35 Add 50% ageuous sodium hydroxide (4.48mL, 56mmol). Stir and heat at reflux for 30 minutes then remove the ethanol in vacuo. Extract the aqueous residue with methylene chloride (2X25mL), wash with water (2X25mL), dry (MgSO4) and

evaporate the solvent *in vacuo* to give the title compound as a brown oil (2.91g, 95.3%).

5 ¹H NMR (300MHz, CDCl₃) δ 1.03, 1.20 (2H each, m), 1.35 (6H, s), 1.70 (1H, t, br), 2.66 (1H, m), 3.64 (2H, d), 7.48, 7.98 (2H each, d).

Example 40

10

Step d₂: 2-(4-(4-Chloro-2-oxo-butyl))-phenyl-2methylpropionic acid

Mix powdered potassium permanganate (39.5g, 0.25mol), water (34mL) and acetic acid (200mL). Stir and cool at 0°C, then 15 add 85% phosphoric acid (4.2q). Stir vigorously and add 2-(4-(4-chloro-1-oxo-butyl))-phenyl-2-methylpropanol (24.5g, 0.lmol) in acetic acid (50mL) at such a rate as to keep the temperature below 5°C. Stir for 5.5 hours below 5°C, add ice water (300mL), then sodium metabisulfite (45g) in small 20 portions until the dark brown mixture becomes colorless. Extract the aqueous solution with methylene chloride (3X150mL), wash with water (100mL) then extract with 20% aqueous potassium carbonate (2X150mL). Wash the aqeuous phase with methylene chloride (50mL), cool in an ice-bath 25 and acidify carefully with concentrated hydrochloric acid until pH 3. Extract with methylene chloride (2X150mL), wash wih water (2X80mL) and dry (MgSO4). Evaporate the solvent in vacuo to give the title compound as a crystalline solid (21.25g).

30

¹H NMR (300MHz, CDCl₃) δ 1.63 (6H, s), 2.22 (2H, quent.), 3.17 (2H, t), 3.67 (2H, t), 7.50, 7.92 (2H each, d), 12.3 (1H, s, br).

35

Example 41

Step d₅: 2-(4-(1-0xo-1-cyclopropanyl))-phenyl-2-methylpropionic acid

Method A:

Mix 2-(4-(1-oxo-1-cyclopropanyl))-phenyl-2-methylpropanol

(1.46g, 6.7mmol), ruthenium chloride (0.036g, 0.17mmol),
acetonitrile (14mL), carbon tetrachloride (14mL) and water
(20mL). Stir vigorously and add sodium periodate (5.85g)
in one portion. Stir at room temperature for one hour
longer, partition between methylene chloride (20mL) and
water (5mL), separate the organic layer, extract the
aqeuous layer with methylene chloride (15mL) and wash the
combined methylene chloride layers with water (15mL) and
extract with 20% aqueous potassium carbonate (2X25mL).
Cool the base solution in an ice-bath, acidify carefully
with concentrated hydrochloride acid to pH 3 and extract
into methylene chloride (2X30mL). Wash with water (15mL),
dry (MgSO4) and evaporate the solvent invacuo to give the
title compound as a yellow oil (1.41g, 90%).

20 ¹H NMR (300MHz, CDCl₃) δ 1.04, 1.23 (2H each, d), 1.63 (6H, s), 2.65 (1H, m), 7.50, 7.99 (2H each, d).

Method B:

Mix 2-(4-(1-oxo-1-cyclopropanyl))-phenyl-2-methylpropanol

(10.9g, 50mmol), ruthenium chloride (0.032g, 0.16mmol),
acetic acid (100ml) and water (25mL). Cool to 10°C and
add, by dropwise addition, an aqueous solution of sodium
hypochloride (70ml), stirring vigorously over a 30-minute
period. Stir below 10°C for 30 minutes longer, evaporate

most of the solvent invacuo and take the residue up in
methylene chloride (120mL). Wash the methylene chloride
solution with water (2X40mL) and extract with 20% aqueous
potassium carbonate (2X50mL). Cool the base solution in an
ice-bath, acidify carefully with concentrated hydrochloride
acid to ph 3 and extract into methylene chloride (2X50mL).
Wash the organic layer with water (40mL), dry (MgSO₄) and
evaporate the solvent invacuo to give the title compound as
a light-yellow oil (5.46g, 47%).

Method C:

Mix potassium permanganate (3.61g, 22.8mmol), water (2mL) 5 and acetic acid (10mL). Stir and cool to 10°C and add 85% phosphoric acid (500mg). Add, by dropwise addition, a solution 2-(4-(1-oxo-1-cyclopropanyl))-phenyl-2methylpropanol (1.66g, 7.6mmol) in acetic acid (5mL) over 5 minutes. Stir below 10°C for 1 hour and then at room 10 temperature for 5 hours. Add water (20mL) followed by addition of Na₂S₂O₅ in small portions until the solution becomes colorless. Extract with methylene chloride (2X50mL), wash the methylene chloride solution with water (30mL) and then extract with 10% aqueous potassium 15 carbonate (2X50mL). Cool the base solution in an ice-bath, acidify carefully with concentracted hydrochloric acid to pH 3 and extract with methylene chloride (2X50mL). Wash the organic layer with water (20mL), dry (MgSO₄) and evaporate the solvent invacuo to give the title compound as 20 a colorless needles (1.20g, 68%).

¹H NMR (300MHz, CDCl₃) δ 1.00 (4H, d), 1.50 (6H, s), 7.49, 8.00 (2H each, d), 12.6 (1H, s, br).

25 Method D:

Mix 2-(4-(1-oxo-1-cyclopropanyl))-phenyl-2-methylpropanol (2.30g, 10.6mmol), acetic acid (5.5mL) and fuming nitric acid (6.5mL). Stir and heat at 48-50°C for 2 hours, cool and add ice water (20mL) followed by methylene chloride

30 (60mL). Separate the organic layer, wash with water (2X20mL) and extract into 10% aqueous potassium carbonate (2X40mL). Wash the alkaline solution with methylene chloride (10mL) and cool in an ice-bath. Acidify carefully with concentrated hydrochloric acid to ph 3, extract with methylene chloride (2X40mL), wash the combined organic layers with water (20mL), dry (MgSO₄) and evaporate the solvent invacuo to give the title compound as light-yellow needles (1.89g, 77%).

Method E:

Mix 2-(4-(1-oxo-1-cyclopropanyl))-phenyl-2-methylpropanol

(2.26g, 10.4mmol), sodium nitrite (60mg), acetic acid (5mL)
and concentrated nitric acid (6mL, d=1.42, 70%, 94mmol).

Stir and heat at 48-50°C for 2 hours, cool and dilute with ice water (20mL). Extract into methylene chloride
(2X30mL), wash the combined organic layers with water

(2X20mL) and extract into 10% ageuous potassium carbonate
(2X40mL). Wash the alkaline solution with methylene
chloride (10mL) and cool in an ice-bath. Acidify carefully
with concentrated hydrochloric acid to pH 3 and extract
into methylene chloride (2X40mL). Wash the combined

organic layers with water (20mL), dry (MgSO4) and evaporate
the solvent in vacuo to give the title compound as light
yellow needels (2.01g, 83%).

Example 42

20

Step d₆: 2-(4-(1-0xo-1-cyclopropanyl))-phenyl-2methylpropionic acid

Mix 2-(4-(1-oxo-1-cyclopropanyl))-phenyl-2-methylpropanyl acetate (5.0g, 0.0197mol), sodium nitrite (100mg), acetic 25 acid (10mL) and concentrated nitric acid (8.7mL, d=1.42, 70%, 0.137mol). Stir and heat at 48-50°C for 5.5 hours, cool and dilute with ice water (40mL). Extract into methylene chloride (2X70mL), wash the combined methylene chloride extracts with water (2X50mL) and reduce the volue 30 to 50mL invacuo. Extract with 10% aqueous potassium carbonate (2X50mL), was the base solution with methylene chloride (20mL) and cool in an ice-bath. Acidify carefully with concentrated hydrochloric acid to pH 3 and extract into methylene chloride (2X60mL). Wash the combined 35 methylene chloride extracts with water (30ml), dry (MgSO4) and evaporate the solvent invacuo to give the title compound asa crystalline solid (4.12g, 90%).

The novel intermediates of formula (X) wherein R₅ is H, Br, Cl, I, CN, -COOH, -COOAlkyl or -CONR₆R₇ may be prepared as described in Scheme J. In Scheme J, all substituents are as previously defined unless otherwise indicated.

Scheme J

Scheme J provides various general synthetic procedures for preparing the novel intermediates of formula (X) wherein R₅ is H, Br, Cl, I, CN, -COOH, -COOalkyl or -CONR₆R₇.

WO 95/00480 PCT/US94/05982

In step a, the ketone functionality of the appropriate
 w-halo-halocumylketone compound of structure (10) is
5 reduced to give the corresponding ω-halo-halocumylalcohol
 compound of structure (60).

For example, reduction of the appropriate w-halohalocumylketone compound of structure (10), using, for 10 example, a suitable reducing agent such as sodium borohydride, potassium borohydride, sodium cyanoborohydride, or tetramethylammonium borohydride is carried out in lower alcohol solvents, such as, methanol, ethanol, isopropyl alcohol or n-butanol at temperatures 15 ranging from about 0°C to the reflux temperature of the solvent, and the reaction time varies from about 1/2 hour to 8 hours. Other suitable reducing agents are, for example, lithium tri-tert-butylaluminohydride and diisobutylaluminum hydride. These reduction reactions are 20 carried out in suitable solvents diethyl ether, tetrahydrofuran or dioxane at temperatures ranging from about 0°C to the reflux temperature of the solvent, and the reaction time varies from about 1/2 hour to 8 hours.

Catalytic reduction may also be employed in the preparation of appropriate ω-halo-halocumylalcohol compound of structure (60) from an appropriate ω-halo-halocumylketone compound of structure (10), using hydrogen gas in the presence of a suitable catalyst such as Raney nickel, palladium, platinum or rhodium catalysts in lower alcohol solvents, such as, methanol, ethanol, isopropyl alcohol or n-butanol or acetic acid or their aqueous mixtures, or by the use of aluminum isopropoxide in isopropyl alcohol.

35

In addition, a chiral reduction of the appropriate ω -halo-halocumylketone compound of structure (10), using, for example, (+)-B-chlorodiisopinocamphenylborane gives the

corresponding (R)-ω-halo-halocumylalcohol compound of structure (60) and (-)-B-chlorodiisopinocamphenylborane gives the corresponding (S)-ω-halo-halocumylalcohol 5 compound of structure (60). Other suitable chiral reducing agents are, (R) and (S)-oxazaborolidine/BH3, potassium 9-0-(1,2:5,6-di-O-isopropylidine-α-D-qlucofuransoyl)-9boratabicyclo[3.3.1]nonane, (R) and (S)-B-3-pinany1-9borabicyclo[3.3.1]nonane, NB-Enantride, Lithium (R)-(+) and 10 (S)-(-)-2,2'-dihydroxy-1,1'-binaphthyl alkoxyl aluminum hydride, (R)-(+) and (S)-(-)-2,2'-dihydroxy-6,6'dimethylbiphenyl borane-amine complex, tris[[(1S,2S,5R)-2isopropyl-5-methyl-cyclohex-l-yl]methyl]aluminum, [[(1R,3R)-2,2-dimethylbicyclo[2.2.1]hept-3-15 yl]methyl]beryllium chloride, (R)-BINAP-ruthenium complex/H2 and 6,6'-bis(diphenylphosphino)-3,3'-dimethoxy-2,2',4,4'tetramethyl-1,1'-biphenyl.

In step b, the ketone functionality of the appropriate ω-halo-cyanocumylketone compound of structure (19) is reduced to give the corresponding ω-halo-cyanocumylalcohol compound of structure (61) as described previously in step a.

In step c, the ketone functionality of the appropriate ω-halo-cyanocumylketone compound of structure (8) is reduced to give the corresponding ω-halo-cyanocumylalcohol compound of structure (62) as described previously in step a.

30

In step d, the α-halo functionality of the appropriate ω-halo-halocumylalcohol compound of structure (60) is cyanated to give the corresponding ω-halo-cyanocumylalcohol compound of structure (61) as described previously in 35 Scheme D, step a.

In step e, the appropriate ω -halo-cyanocumylalcohol compound of structure (62) is cyanated to give the

PCT/US94/05982

corresponding ω -halo-cyanocumylalcohol compound of structure (61) as described previously in Scheme D, step b.

5 In step f, the appropriate appropriate ω-halocyanocumylalcohol compound of structure (62) is halogenated to give the corresponding ω-halo-halocumylalcohol compound of structure (60) as described previously in Scheme B, step a.

10

In step g, the α-halo functionality of the appropriate ω-halo-halocumylalcohol compound of structure (60) is converted to the corresponding carboxy to give the ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid compound of structure (64) as described previously in Scheme H, step h.

In step h, the nitrile functionality of the appropriate w-halo-cyanocumylalcohol compound of structure (61) is converted to the corresponding ester to give the w'-halo20 α'-hydroxy-α,α-dimethylphenylacetic acid ester compound of structure (63) as described previously in Scheme H, step a.

In step i, the nitrile functionality of the appropriate w-halo-cyanocumylalcohol compound of structure (61) is
converted to the corresponding acid to give the w'-halo-a'-hydroxy-a,a-dimethylphenylacetic acid compound of structure (64) as described previously in Scheme H, step e.

In step j, the nitrile functionality of the appropriate 30 ω-halo-cyanocumylalcohol compound of structure (61) is converted to the corresponding amide to give the ω'-haloα'-hydroxy-α,α-dimethylphenylacetic acid amide compound of structure (65) wherein R₆ and R₇ are each hydrogen as described previously in Scheme H, step b.

35

In step k, the ketone functionality of the appropriate ω' -halo- α' -keto- α,α -dimethylphenylacetic acid ester compound of structure (31) is reduced to give the

corresponding ω' -halo- α' -hydroxy- α , α -dimethylphenylacetic acid ester compound of structure (63) as described previously in step a.

5

In step 1, the ketone functionality of the appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetic acid compound of structure (46) is reduced to give the corresponding ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid compound of structure (64) as described previously in step a.

In step m, the ketone functionality of the appropriate ω'-halo-α'-keto-α,α-dimethylphenylacetic acid amide compound of structure (40) is reduced to give the corresponding ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid amide compound of structure (65) as described previously in step a.

In step n, the carboxy ester functionality of the appropriate ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid ester compound of structure (63) is hydrolyzed to give the corresponding ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid compound of structure (64) as described previously in Scheme H, step c.

25

In step o, the carboxy functionality of the appropriate ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid compound of structure (64) may be esterified by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid ester compound of structure (63) as described previously in Scheme H, step-d.

In step p, the carboxy functionality of the appropriate ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid compound of structure (65) may be amidated by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding ω'-halo-α'-

hydroxy- α , α -dimethylphenylacetic acid amide compound of structure (57) as described previously in Scheme H, step g.

5 In step q, the amide functionality of the appropriate ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid amide compound of structure (65) is converted to the corresponding acid by acid hydrolysis as is known in the art to give the ω'-halo-α'-hydroxy-α,α-dimethylphenylacetic acid compound of structure (64) as described previously in Scheme H, step f.

In addition, the novel intermediates of formula (X) wherein R₅ is -CH₂OD may be prepared as described in Scheme K. In Scheme K, all substituents are as previously defined unless otherwise indicated.

Scheme K Cont.

20

25

 $D = H_1 - C(=0)CH_3$, $-C(=0)C_6H_5$,

30

In Scheme K, the ketone functionality of the appropriate ω'-halo-α'-keto-(2-methylpropanol)benzene compound of structure (60) is reduced to give the corresponding ω'-halo-α'-hydroxy-(2-methylpropanol)benzene compound of structure (66) as described previously in Scheme J, step a.

10

15

20

25

30

The novel intermediates of formula (XI) wherein R_5 is hydrogen, CN, COOalkyl or CONR₆R₇ may be prepared as described in Scheme L. In Scheme L, all substituents are 5 as previously defined unless otherwise indicated.

10

15

20

25

30

Scheme L

30

R5' is H, CN, COOalkyl or CONR6R7

35

Scheme L provides various general synthetic procedures for preparing the novel intermediates of formula (XI) wherein R_5 is hydrogen, CN, COOalkyl or CONR₆R₇.

.

In step a, the w'-halo functionality of the appropriate
w'-halo-a'-keto-a,a-dimethylphenyl compound of structure

5 (67) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇ is
alkylated with the appropriate piperidine compound of
structure (68) to give the corresponding w'-piperidine- a'keto-a,a-dimethylphenyl compound of structure (69) wherein
R₅ is hydrogen, CN, COOalkyl or CONR₆R₇.

10

For example, the ω'-piperidine- α'-keto-α,αdimethylphenyl compound of structure (69) wherein R5 is hydrogen, CN, COOalkyl or CONR₆R₇ may be prepared by reacting the appropriate ω'-halo-α'-keto-α,α-dimethylphenyl 15 compound of structure (67) wherein R5 is hydrogen, CN, COOalkyl or CONR₆R₇ with the appropriate piperidine compound of structure (68) in a suitable solvent preferably in the present of a suitable non-nucleophilic base and optionally in the presence of a catalytic amount of an 20 iodide source, such as potassium or sodium iodide. reaction time varies from about 4 to 120 hours and the reaction temperature varies from about 70°C to the reflux temperature of the solvent. Suitable solvent for the alkylation reaction include alcohol solvents such as, 25 methanol, ethanol, isopropyl alcohol, or n-butanol; ketone solvents, such as, cyclohexanone, methyl isobutyl ketone; hydrocarbon solvents, such as, benzene, toluene or xylene; halogenated hydrocarbons, such as, chlorobenzene or methylene chloride or dimethylformamide. Suitable non-30 nucleophilic bases for the alkylation reaction include inorganic bases, for example, sodium bicarbonate, potassium carbonate, or potassium bicarbonate or organic bases, such as, a trialkylamine, for example, triethylamine or pyridine, or an excess of an appropriate piperidine 35 compound of structure (68) may be used.

For those piperidine compounds of structure (68), wherein R_1 is hydroxy, it is preferred that R_1 be

unprotected for utilization in the alkyation reaction of step a, but those hydroxy functionalities present in the piperidine compounds of structure (68), wherein R1 is 5 hydroxy may be protected with a suitable protecting group. The selection and utilization of suitable protecting groups for the piperidine compounds of structure (68), wherein R1 is hydroxy is well known by one of ordinary skill in the art and is described in "Protective Groups in Organic 10 Syntheses", Theodora W. Greene, Wiley (1981). For example, suitable protecting groups for those hydroxy functionalities present include ethers such as tetrahydrothiopyranyl, tetrahydrothiofuranyl, 2-(phenylselenyl)ethyl ether, o-nitrobenzyl ether, 15 trimethylsilyl ether, isopropyldimethylsilyl ether, tbutyldimethylsilyl ether, t-butyldiphenylsilyl ether, tribenzylsilyl ether, triisopropylsilyl ether; and esters, such as acetate ester, isobutyrate ester, pivaloate ester, adamantoate ester, benzoate ester, 2,4,6-trimethylbenzoate 20 (mesitoate) ester, methyl carbonate, p-nitrophenyl carbonate, p-nitrobenzyl carbonate, S-benzyl thiocarbonate and N-phenylcarbamate.

The piperidine compounds of structure (68) are readily
available to one of ordinary skill in the art and are
described in United States Patent No. 4,254,129, March 3,
1981, United States Patent No. 4,254,130, March 3, 1981,
United States Patent No. 4,285,958, April 25, 1981 and
United States Patent No. 4,550,116, Oct. 29, 1985. The
piperidine compounds of structure (68) wherein R₁ and R₂
form a second bond between the carbon atoms bearing R₁ and
R₂ may be prepared by dehydration of the corresponding
compound wherein R₁ is hydroxy by procedures generally known
in the art, such as refluxing in strongly acidic solution.

35

The piperidine compounds of structure (68) include the limitations provided for previously for piperidine derivatives of formula (I) and (XI) in that when R_1 and R_2

are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0.

5

In step b, the ω'-halo functionality of the appropriate ω-halo-α'-hydroxy-α,α-dimethylphenyl compound of structure (70) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇ is alkylated with the appropriate piperidine compound of structure (68) to give the corresponding ω'-piperidine- α'-hydroxy-α,α-dimethylphenyl compound of structure (71) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇ as described previously in step a.

In step c, the ketone functionality of the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl compound of structure (69) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇ is reduced to give the corresponding ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl compound of structure (71) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇.

For example, reduction of the appropriate ω' piperidine-a'-keto-a,a-dimethylphenyl compound of structure (69) wherein R5 is hydrogen, CN, COOalkyl or CONR6R7, using, 25 for example, a suitable reducing agent such as sodium borohydride, potassium borohydride, sodium cyanoborohydride, or tetramethylammonium borohydride is carried out in lower alcohol solvents, such as, methanol, ethanol, isopropyl alcohol or n-butanol at temperatures 30 ranging from about 0°C to the reflux temperature of the solvent, and the reaction time varies from about 1/2 hour to 8 hours. Other suitable reducing agents are, for example, lithium tri-tert-butylaluminohydride and diisobutylaluminum hydride. These reduction reactions are 35 carried out in suitable solvents diethyl ether, tetrahydrofuran or dioxane at temperatures ranging from about 0°C to the reflux temperature of the solvent, and the. reaction time varies from about 1/2 hour to 8 hours.

Catalytic reduction may also be employed in the preparation of appropriate ω'-piperidine-α'-hydroxy-α,α-5 dimethylphenyl compound of structure (71) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇ from an appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl compound of structure (69) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇, using hydrogen gas in the presence of a suitable catalyst such as Raney nickel, palladium, platinum or rhodium catalysts in lower alcohol solvents, such as, methanol, ethanol, isopropyl alcohol or n-butanol or acetic acid or their aqueous mixtures, or by the use of aluminum isopropoxide in isopropyl alcohol.

15

Reduction using sodium borohydride or potassium borohydride is preferred over catalytic reduction for those ω'-piperidine-α'-keto-α,α-dimethylphenyl compound of structure (69) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇ and wherein R₁ and R₂ taken together form a second bond between the carbon atoms bearing R₁ and R₂.

In addition, a chiral reduction of the appropriate ω' piperidine-a'-keto-a,a-dimethylphenyl compound of structure 25 (69) wherein R₅ is hydrogen, CN, COOalkyl or CONR₆R₇, using, for example, (+)-B-chlorodiisopinocamphenylborane gives the corresponding (R)-w'-piperidine-a'-keto-a,a-dimethylphenyl compound of structure (69) wherein R5 is hydrogen, CN, COOalkyl or CONR₆R₇ and (-)-B-chlorodiisopinocamphenylborane 30 gives the corresponding (S)- ω '-piperidine- α '-keto- α , α dimethylphenyl compound of structure (69) wherein R5 is hydrogen, CN, COOalkyl or CONR₆R₇.—Other suitable chiral reducing agents are, (R) and (S)-oxazaborolidine/BH3, potassium 9-0-(1,2:5,6-di-0-isopropylidine-a-D-35 glucofuransoyl)-9-boratabicyclo[3.3.1]nonane, (R) and (S)-B-3-pinanyl-9-borabicyclo[3.3.1]nonane, NB-Enantride, Lithium (R)-(+) and (S)-(-)-2,2'-dihydroxy-1,1'-binaphthylalkoxyl aluminum hydride, (R)-(+) and (S)-(-)-2,2'-

dihydroxy-6,6'-dimethylbiphenyl borane-amine complex,
 tris[[(1S,2S,5R)-2-isopropyl-5-methyl-cyclohex-1 yl]methyl]aluminum, [[(1R,3R)-2,2
5 dimethylbicyclo[2.2.1]hept-3-yl]methyl]beryllium chloride,
 (R)-BINAP-ruthenium complex/H2 and 6,6' bis(diphenylphosphino)-3,3'-dimethoxy-2,2',4,4'-

Starting materials for use in Scheme L are readily available to one of ordinary skill in the art.

tetramethyl-1,1'-biphenyl.

The following examples present typical syntheses as described in Scheme K. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "µL" refers to microliters; "µg" refers to micrograms; and "µM" refers to micromolar.

25

30

Example 43

Step a: 4-[4-(4-(Hydroxydiphenylmethyl)-1-piperidinyl]-1oxobutyl]-α,α-dimethylbenzeneacetic acid methyl ester
Mix methyl 4'-(4-chloro-1-oxobutyl)-α,α-dimethylbenzene
acetate (0.335mol), α,α-diphenyl-4-piperidinemethanol
(101.8g, 0.335mol), potassium hydrogen carbonate (83.8g,
0.838mol), potassium iodide (1.00g, 0.006mol), toluene
10 (600mL) and water (220mL). Stir at reflux for 72 hours,
add toluene (200mL) and deionized water (100mL). Filter
through filter aid while at 80°C and separate the organic
phase. Dry (MgSO₄), filter and purify by chromatography to
give the title compound.

15

Example 44

Step a: 4-[4-[4-(Hydroxydiphenylmethyl)-1-piperidinyl]-1oxobutyl]-α,α-dimethylbenzeneacetic acid ethyl ester

Method A: Remove the still head from the reaction flask containing a solution of ethyl 4'-(4-chloro-1-oxobutyl)a,a-dimethylbenzene acetate and xylenes obtained from Example 11, Method G and reattach a reflux condenser. At ambient temperature, add azacyclonol free base which has 25 been recrystallized from toluene (178.28g, 0.660mol) and stir at 175 RPM while heating by heating mantle. temperature of the reaction slurry reaches 137 (approximately 30 minutes), stir the reaction for 5.5 hours, maintaining the temperature between 137-144C. 30 Remove the heating mantle, add mixed xylenes (100mL) and allow the reaction slurry to cool to 64C. Increase the stirring rate to 300 RPM and add glacial acetic acid (15.17g, 0.253mol). Maintain the temperature at 64-69C for 1.9 hours by heating with mantle, cool from 64-60C over a 35 period of 15 minutes; and from 60-50C over a period of 32 minutes; from 50-42C over a period of 33 minutes. Filter at 42C by suction through a 350 mL coarse sintered glass filter funnel and wash the filtercake with mixed xylenes

(200mL) at ambient temperature. Allow the filtrate to stand at ambient temperature overnight then place in a lL flask. Add isopropanol (40mL) and attached an overhead paddle stirrer. With stirring at 150 RPM, slowly add 37% ageuous concentrated HCl at ambient temperature, adding 2.00g during the first 17 minutes, adding a total of 33.13 g of HCl over 245 minutes. After the slurry has been digested, collect the solids by suction filtration through a 350mL coarse sintered glass funnel and wash the filtercake with fresh xylenes (200mL) and then with nheptane (100mL). Dry the filtercake under vacuum at 47C for 2.5 days to give the title compound as an off-white solid (141.17g, 81%).

15

Concentrate the filtrate by rotary evaporator to give a thick residue of solids and syrup (23.78g) Add acetone (68g) and agitate by swirling until the syrup dissolves or releases as a solid. Collect the solids by suction filtration through a medium sintered glass funnel, wash with fresh acetone (17g) and dry under vacuum to give the title compound as a light tan solid (3.75g).

Method B: Place the solution of ethyl 4'-(4-chloro-1-oxobutyl)-α,α-dimethylbenzene acetate and xylenes obtained from Example 11, Method G in a 1L, 3-neck round bottom flask and add azacyclonol free base recrystallied from toluene (192.2g, 0.719mol). Stir the resulting slurry by overhead stirrer and heat to 140C for 5.5 hours. Allow to cool to ambient temperature and add a mixture of 4-[4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]-1-oxobutyl]-α,α-dimethylbenzeneacetic acid ethyl ester hydrochloride (33.8g, 0.0318 mol) and azacyclonol hydrochloride (0.0534mol), slurried in mixed xylenes (100mL). Reheat the resulting slurry to 135C with stirring and then allow to cool slowly to ambient temperature.

Vacuum filter and wash the filtercake with xylenes. Dry the filtercake under vacuum to give a solid (122.4g). Concentrate the filtrate by rotary evaporator to a weight ot 486g and add, by dropwise addition, 91g (2.75g, 0.0753mol) of a solution of HCl gas (5.6g) in absolute 2B ethanol (180mL) at 70-80C over a 1.5 hour period. Cool slowly to 30C and filter by vacuum. Wash the filtercake with mixed xylenes and dry under vacuum at 50C to give the title compound as a solid (49.1g).

To the filtrate from the second filtercake, add absolute 2B ethanol (100mL), heat to 50C and sparge gaseous HCl (about 5g) into the solution. Add additional mixed xylenes

15 (170mL) and absolute 2B ethanol (100mL) and heat to 70C. Sparge in additional HCl gas until the total HCl added is 10g (0.274mol). Cool to 50C and stir for 2 hours then cool to ambient temperature and stir overnight.

20 Distill a total of 240mL of ethanol and xylenes from the slurry under reduced pressure (80mm, with pot temperature from 50 to 70C). Cool to 30C over a 1 hour period and filter by vacuum. Wash the filtercake with toluene and dry under vacuum at 50C to give the title compound as a solid 25 (119.2g).

Method C: Place ethyl 4'-(4-chloro-1-oxobutyl)-a,a-dimethylbenzene acetate (15.00g, 49.53mmol), azacyclonol free base (29.66g, 49.53mmol) and mixed xylenes (60mL) in a 250mL 1-neck round bottom flask fitted with a magentic stir bar and reflux condenser. Heat the reaction mixture to reflux over a period of 15 minutes and then continue at reflux for 5.5 hours. Cool to ambient temperature and then to ice/water bath temperature. Separate the solids from 35 the orange xylenes solution by suction filtration through a coarse sintered glass funnel, wash the filtercake with cold xylenes (25mL) and dry in a vacuum oven at 60C to give the title compound as an off-white solid (16.21g).

Method D: Place azacyclonol free base (35.00g, 125.68mmol), ethyl 4'-(4-chloro-l-oxobutyl)-α,α5 dimethylbenzene acetate (17.30g, 57.13mmol) and mixed xylenes (60mL) into a 250mL round bottom flask. Heat to reflux by mantel in 13 minutes and stir by megnetic bar and heat at reflux for 6.3 hours. Remove the heat from the reaction flask and cool by ice/water bath. Filter the cold 10 reaction slurry by suction through a coarse sintered glass funnel and wash the filtercake with fresh mixed xylenes (40mL). Vacuum dry the filtercake at 40C overnight to give the title compound as a solid (17.87g).

15 Add concentrated 37% HCl (2.18g, 22.1mmol) to the filtrate, stirred by magnetic bar. Stir overnight at ambient temperature, filter through suction through a coarse sintered glass funnel and wash the filtercake with fresh mixed xylenes (35mL) Vacuum dry the filtercake at 50C to give the title compound as a solid (8.23g).

Add concentrated 37% HCl (6.42g, 65.2mmol) to the filtrate stirred by magnetic bar. Add mixed xylenes (70mL) and filter though a coarse sintered glass funnel, at ambient temperature. Wash the filtercake with fresh mixed xylenes (50mL) and vacuum dry the filtercake to give the title compound as a solid (27.25g).

Purify by recrystallization as follows: Mix the title

30 compound (15g), absolute 2B ethanol (45mL) and n-heptane
(90mL) in a 500 mL round bottom flask with a magentic stir
bar. Heat at reflux with stirring for 30 minutes, cool by
ice/water bath and collect the solids by suction filtration
through a coarse sintered glass funnel. Wash the

35 filtercake with 3:l n-heptane/ethanol (24mL) and dry under
vacuum at 55C to give the title compound as a white solid.

Example 45

....

Step c: 4-[4-(4-(Hydroxydiphenvlmethyl)-1-piperidinyl]-1-hydroxybutyl]-\alpha,\alpha-dimethylbenzeneacetic acid
Add sodium borohydride (0.105g, 2.77mmol) to a solution of
sodium hydroxide (0.053g, 1.33mmol) in deionized water
(2mL) and add, by dropwise addition, to a solution of 4-[4[4-(hydroxydiphenylmethyl)-1-piperidinyl]-1-oxobutyl]-\alpha,\alphadimethylbenzeneacetic acid hydrochloride (0.70g, 1.31mmol)
in ethanol (30mL). Stir at room temperature for 3.5 hours
10 at pH 7-8. Evaporate the solvent invacuo and stir the
residue with methylene chloride (15mL) and deionized water
(15mL). Dry (MgSO4), acidify to pH 3 with gaseous hydrogen
chloride and evaporate the solvent. Add ether with
stirring, filter the white solid and wash with additional
15 ether. Dry to give the title compound.

Example 46

Step c: (R)-4-[4-[4-(Hydroxydiphenylmethyl)-1piperidinyl]-1-hydroxybutyl]-α,α-dimethylbenzeneacetic,
20 ethyl ester

Dissolve (+)-B-chlorodiisopinocamphenylborane (2.5g, 7.8mmol) in anhydrous tetrahydrofuran (5mL). Add a solution of 4-[4-[4-(hydroxydiphenylmethyl)-l-piperidinyl)-l-oxobutyl]-a,a-dimethylbenzeneacetic, ethyl ester (2g, 2.54mm).

25 3.54mmol) in anhydrous tetrahydrofuran (5mL). Stir at room temperature for 3 days and cool to 0°C. Add water (1mL) and 30% hydrogen peroxide (2mL) and stir for 20 minutes. Add methylene chloride (30mL) and wash with brine (30mL), then aqueous sodium hydrogen carbonate (30mL), then brine

30 (30mL). Dry (MgSO₄), evaporate the solvent *in vacuo* and purify by chromatography to give the title compound.

Example 47

Step c: (S)-4-[4-(Hydroxydiphenylmethyl)-1-

35 piperidinyl]-l-hydroxybutyl]-α,α-dimethylbenzeneacetic acid, ethyl ester

Dissolve (-)-B-chlorodiisopinocamphenylborane (2.5g, 7.8mmol) in anhydrous tetrahydrofuran (5mL). Add a

solution of 4-[4-[4-(hydroxydiphenylmethyl)-l-piperidinyl]l-oxobutyl]-α,α-dimethylbenzeneacetic acid, methyl ester
(3.54mmol) in anhydrous tetrahydrofuran (5mL). Stir at

5 room temperature for 3 days and cool to 0°C. Add water
(lmL) and 30% hydrogen peroxide (2mL) and stir for 20
minutes. Add methylene chloride (30mL) and wash with brine
(30mL), then aqueous sodium hydrogen carbonate (30mL), then
brine (30mL). Dry (MgSO₄), evaporate the solvent in vacuo

10 and purify by chromatography to give the title compound.

Example 48

Step a: N,N-Dimethyl-2-(4-{4-[4-hydroxy-diphenylmethyl)-piperidin-1-yl}-butyryl}-phenyl)-isobutyramide

Dissolve N,N-dimethyl-2-[4-(4-chlorobutyryl)-phenyl]isobutyramide (1.00g, 3.38mmol) in xylene (3mL) and add
α,α-diphenyl-4-piperidinemethanol (1.09g, 4.07mmol) and
potassium hydrogen carbonate (0.68g, 6.76mmol) in water
(2.5mL). Heat at 100°C for 20 hours, remove hot water by
pipette, dilute with ethyl acetate (20mL) and wash with
water (20mL). Cool the organic layer to room temperature,
dry (MgSO₄), evaporate the solvent invacuo and purify by
silica gel chromatography (9:1 ethyl acetate/methanol) and
recrystallize (ethyl acetate/hexane) to give the title
compound (1.13g, 63%) as a crystalline solid; mp 135-137°C.

Example 49

Step c: N,N-Dimethyl-2-(4-{1-hydroxy-4-{4-hydroxy-diphenylmethyl}-piperidin-1-yl}-butyry}-phenyl)-

30 <u>isobutyramide</u>

Dissolve N,N-dimethyl-2-(4-{4-[4-hydroxy-diphenylmethyl)-piperidin-l-yl]-butyryl}-phenyl)-isobutyramide (3.00g, 5.69mmol) in ethanol (30mL), cool using an ice/water bath and add sodium borohydride (0.87g, 23.04mmol) in tetrahydrofuran (10mL). Remove the cold bath and stir at room temperature for 2.5 hours. Add water (25mL) and ethyl acetate (25mL) and separate the layers. Extract the

aqueous layer with ethyl acetate (20mL), dry (MgSO₄) and

evaporate the solvent *invacuo* to give the title compound (3.06g, 100%) as a white foam; mp 166-169°C.

5 MS (CI, CH₄) m/e 529 (M⁺+1), 280, 183.

Anal. Calcd for $C_{34}H_{44}N_2O_3 \cdot 0.3H_2O$: C, 77.24; H, 8.39; N, 5.30; Found: C, 76.99; H, 8.36; N. 5.17.

10

Example 50

Step a: N-Methoxy-N-methyl-2-(4-{4-[4-hydroxy-diphenylmethyl)-piperidin-l-yl]-butyryl}-phenyl)-isobutyramide

Dissolve N-methoxy-N-methyl-2-[4-(4-chlorobutyryl)-phenyl]isobutyramide (1.44g, 4.62mmol) in 2:1 xylene/water (5mL)
and add α,α-diphenyl-4-piperidinemethanol (1.36g, 5.07mmol)
and potassium hydrogen carbonate (0.93g, 9.24mmol). Heat
at 108°C for 22 hours, remove hot water by pipette, cool to
room temperature and stir for 2 days. Evaporate the
solvent in vacuo and purify by silica gel chromatography
(10:1 ethyl acetate/methanol) and recrystallize (ethyl
acetate) to give the title compound (1.77g, 71%) as a white
crystalline solid; mp 159-160.5°C.

25 MS (CI, CH₄) m/e 543 (M⁺+1), 293, 250, 183.

Anal. Calcd for $C_{34}H_{42}N_2O_4 \cdot 0.3H_2O$: C, 74.50; H, 7.83; N, 5.11; Found: C, 74.75; H, 7.96; N. 5.15.

30

Example 51

Step c: N-Methoxy-N-methyl-2-(4-{1-hydroxy-4-[4-hydroxy-diphenylmethyl)-piperidine-1-yl]-butyryl}-phenyl)isobutyramide

Dissolve N-methoxy-N-methyl-2-(4-{4-{4-hydroxy-35 diphenylmethyl}-piperidin-l-yl}-butyryl}-phenyl)isobutyramide (8.83g, 16.27mmol) in 3.5:1
methanol/tetrahydrofuran (85mL). Add sodium borohydride
(0.62g, 16.27mmol) in 8 portions over 20 minutes at room

temperature. Stir at room temperature for 2 hours, evaporate the solvent in vacuo, dissolve the residue in ethyl acetate (60mL) and add water (25m). Stir at room temperature for 10 minutes, separate the layers and wash the organic layer with brine (2x25mL). Combine the organic layers, extract with ethyl acetate (35mL), dry (Na₂SO₄), evaporate the solvent in vacuo and dry to give the title compound (8.89g, 100%) as a foam; mp 80-83°C.

10

MS (CI, CH₄) m/e 545 (M $^{+}$ +1), 280, 236, 183.

Anal. Calcd for $C_{34}H_{44}N_2O_4 \cdot 0.2H_2O$: C, 74.47; H, 8.16; N, 5.12; Found: C, 74.08; H, 8.16; N. 4.93.

15

Example 52

Step a: 1-[4-(1,1-Dimethyl-2-oxo-2-pyrrolidin-1-yl-ethyl)-phenyl]-4-[4-hydroxy-diphenylmethyl)-piperidine-1-yl]-butan-1-one

- Dissolve 4-chloro-1-[4-(1,1-dimethy1-2-oxo-2-pyrrolidin-1-y1-ethy1)-phenyl]-butan-1-one (6.88g, 21.38mmol) in xylene (14mL) and add a suspension of α,α-diphenyl-4-piperidinemethanol hydrochloride (6.50g, 23.51mmol) and potassium carbonate (6.14g, 4.44mmol) in water (30mL).
- 25 Heat at 100°C for 24 hours, cool to room temperature, add methylene chloride (100mL) and separate the layers.

 Extract the aqueous layer with methylene chloride (100mL), wash with water (150mL), dry (Na₂SO₄), evaporate the solvent in vacuo and purify by silica gel chromatography (4:1 ethyl
- 30 acetate/methanol) to give the title compound (8.20g, 70%) as an off-white solid.

Anal. Calcd for $C_{36}H_{44}N_2O_3 \cdot 2H_2O$: C, 77.72; H, 8.04; N, 5.08; Found: C, 77.38; H, 7.91; N, 4.93.

35

Example 53

Step c: 2-(4-{1-Hydroxy-4-[4-hydroxydiphenylmethyl)-

piperidin-l-yl]-butyl}-phenyl)-2-methyl-l-pyrrolidin-l-ylpropan-l-one

Dissolve 1-[4-(1,1-dimethyl-2-oxo-2-pyrrolidin-1-yl-ethyl)
phenyl]-4-[4-hydroxy-diphenylmethyl)-piperidine-1-yl]
butan-1-one (0.55g, 1.00mmol) in methanol (10mL) and add

sodium borohydride (38mg, 1.00mmol) at 10°C. Stir at room

temperature for 2 hours, evaporate the solvent in vacuo and

dissolve the residue in methylene chloride (60mL). Add

water (10mL) and stir for 10 minutes. Separate the layers,

wash with brine (5mL), dry (Na₂SO₄) and evaporate the

solvent in vacuo to give the title compound (0.53g, 96%) as a

white foam; mp 87-93°C.

15 Example 54

Step a: 4-[4-(Hydroxydiphenylmethyl)-1-piperidinyl]-1oxobutyl]-α,α-dimethylbenzeneacetic acid, ethyl ester hydrochloride

Dissolve 2-[4-(4-chloro-butyryl)-phenyl]-2-methyl-propionic
20 acid, ethyl ester (15.0g, 49.53mmol) and α,α-diphenyl-4piperidinemethanol (29.66g, 106.4mmol) in xylene (60mL).
Reflux for 5.5 hours, cool in an ice bath, filter and wash
with cold xylenes (25mL). Filter the filtrate though
silica gel (20g) and wash the gel with xylenes (40mL). Add
25 xylene (60mL) and concentrated hydrochloric acid (6.45g,
65.6mmol) with stirring. Add additional xylenes (40mL) and
stir for 2 hour. Filter, wash with xylene (50mL), vacuum
dry and slurry with a mixture of ethanol (60mL) and hexane
(120mL) at 70-72°C for 30 minutes. Filter, wash with 3:1
30 v/v solution of n-heptane/ethanol (30mL) and dry to give
the title compound as a light white solid (19.7g, 70%); mp
206-208°C.

35

Example 56

Step c: 4-[4-[4-(Hydroxydiphenylmethyl)-1-piperidinyl]-1-

hydroxybutyl]-a,a-dimethylbenzeneacetic acid, methyl ester hydrochloride

Dissolve 4-[4-[4-(hydroxydiphenylmethyl)-l-piperidinyl]-loxobutyl]-α,α-dimethylbenzeneacetic acid, methyl ester
hydrochloride (550mg, 1.00mmol) in methanol (5mL) and add
sodium borohydride (62.8mg) in three batches. Stir for l
hour, add 50% aqueous sodium hydroxide (800mg) and heat to
reflux with stirring. After 3 hours, cool to -l0°C, add
lo approximately l.5mL of 6N HCl over l0 minutes, filter the
solid and wash with ice water (12mL) such that the final
filtrate is pH=5. Dry the resulting solid invacuo (50-60°C,
l0-1 mm) overnight to give the title compound (515mg, 94%);
mp l65-180°C.

25

Example 57

Step c: 2-(4-(1-Hydroxy-4-(4-(hydroxydiphenylmethyl)-1piperidinyl)-butyl)-phenyl)-2-methyl-propanol
Dissolve 2-(4-(1-oxo-4-(4-(hydroxydiphenylmethyl)-1piperidinyl)-butyl)-phenyl)-2-methylpropanol in methanol
(450mL) and stir for 15 minutes at room temperature. Add,
by dropwise addition, a solution of sodium borohydride
(2.25g, 0.06mol) in water (10mL) over 15 minutes. Stir for
another 30 minutes and cool in an ice-bath. Slowly add
concentrated hydrochloric acid (4mL) and water (8mL) and
stir for an additional 20 minutes. Evaporate the solvent in
vacuo and partition the residue between methylene chloride
(150mL) and water (70mL). Separate the organic phase and

extract the aqueous phase with methylene chloride (25mL). Wash the combined organic layers with water (2X50mL), evaporate the solvent *invacuo* and recrystallize (acetone) to give the title compound as white needles (9.53g, 79%).

¹H NMR (300MHz, DMSO-d₆) δ 7.50 (4H, m), 7.23 (8H, m), 7.12 (2H, m), 5.34 (1H, s, br), 4.65 (1H, t), 4.45 (1H, s), 3.38 (2H, t), 2.60 (2H, m), 2.44 (2H, m), 2.20 (2H, t), 1.62 (2H, t), 1.50 (6H, m), 1.98 (6H, s); ¹³C NMR (DMSO-d₆) δ 147.2, 146.0, 143.4, 127.6, 125.6, 125.5, 125.2, 78.4, 72.0, 70.9, 58.0, 53.6, 53.5, 43.6, 38.0, 30.5, 25.9, 25.5, 23.1.

15

Alternatively, the novel intermediates of formula (XI) may be prepared as described in Scheme M. In Scheme M, all substituents are as previously defined unless otherwise indicated.

20

25

30

Scheme M

W = -C(=O)- or -CH(OH)-

35

Scheme M provides various alternative general synthetic procedures for preparing the novel intermediates of formula (XI).

In step a, the appropriate w'-piperidine-2methylethylphenyl compound of structure (72) is cyanated to
give the corresponding w'-piperidine-a,adimethylphenylacetonitrile compound of structure (73) as
described previously in Scheme D, step b.

In step b, the appropriate ω'-piperidine-2
10 methylethylphenyl compound of structure (72) is halogenated to give the corresponding ω'-piperidine-α,α-dimethylbenzyl halide compound of structure (74) as described previously in Scheme B, step a.

In step c, the nitrile functionality of the appropriate ω'-piperidine-α,α-dimethylphenylacetonitrile compound of structure (73) is converted to the corresponding ester to give the ω'-piperidine-α,α-dimethylphenylacetic acid ester compound of structure (75) as described previously in Scheme H, step a.

In step d, the halo functionality of the appropriate w'-piperidine-\alpha,\alpha-dimethylbenzyl halide compound of structure (74) is converted to the corresponding carboxy to give the w'-piperidine-\alpha,\alpha-dimethylphenylacetic acid compound of structure (76) as described previously in Scheme H, step h.

In step e, the nitrile functionality of the

appropriate w'-piperidine-a,a-dimethylphenylacetonitrile
compound of structure (73) is converted to the
corresponding carboxy to give the w'-piperidine-a,adimethylphenylacetic acid compound of structure (76) as
described previously in Scheme H, step e.

35

In step f, the nitrile functionality of the appropriate ω^* -piperidine- α , α -dimethylphenylacetonitrile compound of structure (73) is converted to the

corresponding amide to give the ω'-piperidine-α,α-dimethylphenylacetic acid amide compound of structure (77) wherein R₆ and R₇ are each hydrogen as described previously in Scheme H, step b.

In step g, the carboxy ester functionality of the appropriate ω'-piperidine-α,α-dimethylphenylacetic acid ester compound of structure (75) is hydrolyzed to give the corresponding ω'-piperidine-α,α-dimethylphenylacetic acid compound of structure (76) as described previously in Scheme H, step c.

In step h, the carboxy functionality of the appropriate w'-piperidine-a,a-dimethylphenylacetic acid compound of structure (76) may be esterified by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding w'-piperidine-a,a-dimethylphenylacetic acid ester compound of structure (75) as described previously in Scheme H, step d.

In step i, the carboxy functionality of the appropriate w'-piperidine-\alpha,\alpha-dimethylphenylacetic acid compound of structure (76) may be amidated by techniques and procedures well known and appreciated by one of ordinary skill in the art to give the corresponding w'-piperidine-\alpha,\alpha-dimethylphenylacetic acid amide compound of structure (77) as described previously in Scheme H, step g.

In step j, the amide functionality of the appropriate ω'-piperidine-α,α-dimethylphenylacetic acid amide compound of structure (77) is converted to the corresponding acid by acid hydrolysis as is known in the art to give the ω'-piperidine-α,α-dimethylphenylacetic acid compound of structure (76) as described previously in Scheme H, step f.

Starting materials for use in Scheme M are readily available to one of ordinary skill in the art.

The following examples present typical syntheses as described in Scheme M. These examples are understood to be illustrative only and are not intended to limit the scope of the present invention in any way. As used herein, the following terms have the indicated meanings: "g" refers to grams; "mmol" refers to millimoles; "mL" refers to milliliters; "bp" refers to boiling point; "°C" refers to degrees Celsius; "mm Hg" refers to millimeters of mercury; "µL" refers to microliters; "µg" refers to micrograms; and "µM" refers to micromolar.

Example 58

Step q: 4-[4-[4-(Hydroxydiphenylmethyl)-l-piperidinyl]-l-oxobutyl]-α,α-dimethylbenzeneacetic acid hydrochloride Dissolve 4-[4-[4-(hydroxydiphenylmethyl)-l-piperidinyl]-l-oxobutyl]-α,α-dimethylbenzeneacetic acid methyl ester (0.13lmol) in methanol (2.5L) and add 10% sodium hydroxide (769mL, 1.92mol). Stir at reflux for 1.5 hours, cool to 68°C and evaporate the solvent invacuo to a residue. Add chloroform (1L) and stir until the solids are dissolved. Separate the organic phase and extract the aqueous phase with chloroform (3X300mL). Combine the organic phases, dry (MgSO4) and evaporate the solvent invacuo to give a residue. Treat the residue with ethereal HCl, filter and dry to give the title compound.

Example 59

Step j: 4-[4-(4-(Hydroxydiphenylmethyl)-1-piperidinyl]-1-hydroxybutyl]-α,α-dimethylbenzeneacetic acid
Dissolve N-methoxy-N-methyl-2-(4-(1-hydroxy-4-(4-hydroxy-diphenylmethyl)-piperidine-1-yl]-butyryl}-phenyl)-isobutyramide (8.35g, 15.33mmol) in isopropanol (50mL) and add potassium hydroxide (8.63g, 153.7mmol). Heat to reflux for 2 hours, add additional potassium hydroxide (4.35g, 77.5mmol) and heat at reflux for an additional 16 hours. Cool to room temperature, treat with concentrated HCl by

dropwise addition until pH = 3. Dilute with water (100mL), stir vigorously for 2 hours, add ethyl acetate (30mL) and stir for 1 hour. Filter to give the title compound (7.15g, 5 87%) as an off-white solid.

MS (CI, CH₄) m/e 502 (M⁺+1), 107.

Anal. Calcd for $C_{32}H_{39}NO_4 \cdot HC1 \cdot 2.6H_2O$: C, 65.70; H, 7.61; N, 10 2.39; Found: C, 65.25; H, 7.70; N, 2.36.

Example 60

Step j: 4-[4-[4-(Hydroxydiphenylmethyl)-l-piperidinyl]-lhydroxybutyl]-α,α-dimethylbenzeneacetic acid

15 Dissolve N,N-dimethyl-2-(4-{l-hydroxy-4-[4-hydroxy-diphenylmethyl)-piperidin-l-yl]-butyry}-phenyl)isobutyramide (15.33mmol) in isopropanol (50mL) and add
potassium hydroxide (8.63g, 153.7mmol). Heat to reflux for
2 hours, add additional potassium hydroxide (4.35g,
77.5mmol) and heat at reflux for an additional 16 hours.
Cool to room temperature, treat with concentrated HCl by
dropwise addition until pH = 3. Dilute with water (100mL),
stir vigorously for 2 hours, add ethyl acetate (30mL) and

25

As one skilled in the art would appreciate, the compounds depicted in Schemes A through M which bear hydroxy or phenolic functionalities may be protected prior to use in the synthesis depicted in Schemes A through M using suitable protecting groups. For example, suitable protecting groups for the phenolic hydroxy include methyl ether, 2-methoxyethoxymethyl ether (MEM), cyclohexyl ether, o-nitrobenzyl ether, 9-anthryl ether, t-butyldimethylsilyl ether, acetate, benzoate, methyl carbamate, benzyl carbamate, aryl pivaloate and aryl methanesulfonate.

stir for 1 hour. Filter to give the title compound (41%).

As one skilled in the art would appreciate, the compounds depicted in Schemes A through M which bear $\alpha-$

ketone functionalities may be protected prior to use in the synthesis depicted in Schemes A through M using suitable protecting groups. The selection and utilization of

5 suitable protecting groups for ketone groups is well known by one of ordinary skill in the art and is described in "Protective Groups in Organic Syntheses", Theodora W. Greene, Wiley (1981). For example, suitable protecting groups for ketone functionalities include acyclic acetals and ketals such as dimethyl acetal, cyclic acetals and ketals such as 1,3-dioxanes and 1,3-dioxolanes, dithio acetals and ketals such as 1,3-dithiane and 1,3-dithiolane, hemithio acetals and ketals, O-substituted cyanohydrins, substituted hydrozones, imines, oxazolidines,

15 imidazolidines and thiazolidines.

As one skilled in the art would appreciate, the compounds depicted in Schemes A through M which bear protected hydroxy and/or ketone functionalities may be reacting with appropriate deprotecting agents prior to use in any of the steps depicted in Schemes A through M. The selection and utilization of appropriate deprotecting reagents is well known by one of ordinary skill in the art and is described in "Protective Groups in Organic Syntheses", Theodora W. Greene, Wiley (1981). Examples of appropriate deprotecting reagents are mineral acids, strong organic acids, Lewis acids, aqueous mineral bases, catalytic hydrogenation and the like.

30 For example, cleavage of β-methoxyethoxymethyl (MEM) protecting groups on any of the compounds depicted in Schemes A through M which bear protected hydroxy ketone functionalities, for example, can be achieved by using trifluoroacetic acid at room temperature or using 5 to 8 equivalents of powdered anhydrous zinc bromide in methylene chloride at about 25°C by the general procedure of E. J. Corey et al., Tetrahedron Letters, 11, 809-812 1976.

In addition, the individual (R) and (S) isomers of the
 w'-piperidine-α'-hydroxy-α,α-dimethylphenyl compounds of
 structure (71) can be prepared by techniques are procedures
well known and appreciated by one of ordinary skill in the
 art.

For example, the mixture of (R) and (S) isomers of the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl compounds of structure (71) may be subjected to chiral chromatography to give the corresponding individual (R)-ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl compounds of structure (71) and (S)-ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl compounds of structure (71).

15

In addition, the individual (R) and (S) isomers of the ω-halo-α'-hydroxy-α,α-dimethylphenyl compound of structure (70) and the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl compounds of structure (71) can be prepared by techniques and procedures well known and appreciated by one of ordinary skill in the art and described in "Enanatiomers, Racemates, and Resolutions", Jacques, Collet and Wilen, Wiley (1981).

One such method involves reacting the mixture of (R) and (S) isomers of the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl compounds of structure (71) with appropriate chiral acids to give the corresponding mixture of diastereomeric acid addition salts. The individual (R)-ω'-30 piperidine-α'-hydroxy-α,α-dimethylphenyl chiral acid addition salt compounds of structure (71) and (S)-ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl chiral acid addition salt compounds of structure (71) are obtained by recrystallization and the individual ω'-piperidine-(R)-α'-hydroxy-α,α-dimethylphenyl compounds of structure (71) and ω'-piperidine-(S)-α'-hydroxy-α,α-dimethylphenyl compounds of structure (71) are obtained by subjecting the individual ω'-piperidine-(R)-α'-hydroxy-α,α-dimethylphenyl chiral acid

addition salt compounds of structure (71) and ω' piperidine-(S)-a'-hydroxy-a,a-dimethylphenyl chiral acid addition salt compounds of structure (71) to base in order 5 to free the piperidine nitrogen from the acid addition complex. Examples of suitable chiral acids are tartaric acid (+), (-), 0,0'-dibenzoyltartaric acid (+), (-), 0,0'di-p-toluyltartaric acid (+), (-), 2-Nitrotartranillic acid (+), (-), mandelic acid (+), (-), malic acid (+), (-), 2-10 phenoxypropionic acid (+), hydratropic acid (+), (-), Nacetylleucine (-), (+), N-(α -methylbenzyl)succinamide (+), (-), N-(o-methylbenzyl)phthalamic acid (+), (-), camphor-10-sulfonic acid (+), 3-bromocamphor-9-sulfonic acid (+), (-), camphor-3-sulfonic acid (+), quinic acid (+), (-), Di-15 O-isopropylidene-2-oxo-L-gulonic acid (-), Lasalocid (-), 1,1'-binaphthyl-2,2'-phosphoric acid (+), (-), chloestenonesulfonic acid.

In addition, the individual (R) and (S) isomers of the 20 ω'-piperidine-a'-hydroxy-a, α-dimethylphenyl compounds of structure (71) can be prepared by reacting the mixture of (R) and (S) isomers of the ω' -piperidine- α' -hydroxy- α , α dimethylphenyl compounds of structure (71) with appropriate organic chiral acids to give the corresponding mixture of 25 diastereomeric acid esters. The individual w'-piperidine- $(R)-\alpha'-\text{ester}-\alpha,\alpha-\text{dimethylphenyl compounds of structure}$ (71) and ω' -piperidine-(S)- α' -ester- α , α -dimethylphenyl compounds of structure (71) are obtained by recrystallization or chromatography and the individual ω' -piperidine-(R)- α' -30 hydroxy-a,a-dimethylphenyl compounds of structure (71) and w'-piperidine-(S)-a'-hydroxy-a,a-dimethylphenyl compounds of structure (71) are obtained by subjecting the individual ω' -piperidine-(R)- α' -ester- α , α -dimethylphenyl compounds of structure (71) and ω' -piperidine-(S)- α' -ester- α , α -35 dimethylphenyl compounds of structure (71) to hydrolysis conditions.

WHAT IS CLAIMED IS:

1. A compound of the formula

5

10 wherein

A is a hydrogen or hydroxy.

2. A compound of the formula

15

wherein

A is a hydrogen or hydroxy.

3. A compound of the formula

25

wherein

A is a hydrogen or hydroxy.

30

4. A compound of the formula

35

wherein

A is a hydrogen or hydroxy.

A compound of the formula

5

wherein

10 A is a hydrogen or hydroxy.

A compound of the formula

15

wherein

A is a hydrogen or hydroxy.

20

A compound of the formula

$$\mathsf{Hal-}(\mathsf{CH}_2)_{n} - \mathsf{C} - \mathsf{CH}_3$$

25

35

wherein

Hal is Cl, Br or I;

n is an integer of from 1 to 5;

A is a hydrogen or hydroxy; and 30

R₅ is H, CH₂OD wherein D is hydrogen, acetate or benzoate, CHO, Br, Cl, I, CN, -COOH, -C(=NH)Oalkyl, or -CONR₆R₇, wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched and R6 and R7 are each independently H, C1-C6alkyl, C1-C6alkoxy or R6 and R7 taken together with the nitrogen atom form a pyrrolidine, piperidine or

morpholine, with the proviso that R_6 and R_7 cannot both be represented by $C_1\text{--}C_6\text{alkoxy}$.

8. A compound of the formula

Hal-
$$(CH_2)_n$$
 CH_2 CH_3

10

wherein

Hal is Cl, Br or I;

n is an integer of from 1 to 5;

A is a hydrogen or hydroxy; and

15 R₅ is H, OH, Br, Cl, I, CN, -COOH, -COOalkyl,

-C(=NH)Oalkyl, or -CONR₆R₇ wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched and R₆ and R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R₆ and R₇ cannot both be represented by C₁-C₆alkoxy.

9. A compound of the formula

25

20

30 wherein

Hal is Cl, Br or I;

n is an integer of from 1 to 5;

A is a hydrogen or hydroxy; and

R₅ is H, OH, Br, Cl, I, CN, -COOH, -COOalkyl,

35 -C(=NH)Oalkyl or -CONR₆R₇ wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched and R₆ and R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with

the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R_6 and R_7 cannot both be represented by C_1 - C_6 alkoxy.

5

10. A compound of the formula

10

20

wherein

Hal is Cl, Br or I;

n is an integer of from 1 to 5;

15 A is a hydrogen or hydroxy; and

R₅ is H, CH₂OD wherein D is hydrogen, acetate or benzoate, CHO, Br, Cl, I, CN, -COOH, -COOalkyl, -C(=NH)Oalkyl or -CONR₆R₇ wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched and R₆ and R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R₆ and R₇ cannot both be represented by C₁-C₆alkoxy; and

25 individual optical isomers thereof.

11. A compound of the formula

wherein

Hal is Cl. Br or I;

n is an integer of from 1 to 5; and A is a hydrogen or hydroxy.

12. A compound of the formula

wherein A is a hydrogen or hydroxy.

13. A compound of the formula

25

20

wherein

W represents -C(=O)- or -CH(OH)-;

R₁ represents hydrogen or hydroxy;

R2 represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

m is an integer 0 or 1;

 R_3 is -COOH or -COOalkyl wherein the alkyl moiety has

from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R₁ and R₂ are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0,

5 comprising using an intermediate compound of the formula

10

wherein

A is a hydrogen or hydroxy; and

R5 is H, OH, Br, Cl, I, CN, -COOH, -COOalkyl or -CONR₆R₇
wherein the alkyl moiety has from 1 to 6 carbon
atoms and is straight or branched and R₆ and
R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy
or R₆ and R₇ taken together with the nitrogen atom
form a pyrrolidine, piperidine or morpholine, with
the proviso that R₆ and R₇ cannot both be
represented by C₁-C₆alkoxy.

16. A process for preparing a compound of the formula

25

30

wherein'

W represents -C(=0)- or -CH(OH)-; R₁ represents hydrogen or hydroxy; R₂ represents hydrogen; or R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ; n is an integer of from 1 to 5;

5 m is an integer 0 or 1;

 R_3 is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0

comprising using an intermediate compound of the formula

15

10

20 wherein

A is a hydrogen or hydroxy; and

R₅ is H, OH, Br, Cl, I, CN, -COOH, -COOalkyl or -CONR₆R₇ wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched and R₆ and R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with the nitrogen atom form a pyrrolidine, piperidine or morpholine, with the proviso that R₆ and R₇ cannot both be represented by C₁-C₆alkoxy.

10

15 wherein

W represents -C(=0)- or -CH(OH)-;

R1 represents hydrogen or hydroxy;

R2 represents hydrogen; or

R₁ and R₂ taken together form a second bond between the

20 carbon atoms bearing R₁ and R₂;

n is an integer of from 1 to 5;

m is an integer 0 or 1;

 R_3 is -COOH or -COOalkyl wherein the alkyl moiety has

from 1 to 6 carbon atoms and is straight or branched;

each of A is hydrogen or hydroxy; and

pharmaceutically acceptable salts and individual optical

isomers thereof, with the proviso that where $\ensuremath{\mathtt{R}}_1$ and $\ensuremath{\mathtt{R}}_2$

are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented

hydroxy, m is an integer 0,

comprising the steps of:

(a) reacting a cumene compound of the formula

35

30

wherein A is as defined above with a $\omega-\text{halo}$ compound of the formula .

wherein B is halo or hydroxy, Hal represents Cl, Br or I and n is as defined above, in the presence of a suitable Lewis acid to produce a w-halo cumylketone compound;

- (b) reacting the $\omega-\text{halo}$ cumylketone compound with a suitable halogenating agent to give a $\omega-\text{halo-halocumylketone}$ compound;
- (c) reacting the ω-halo-halocumylketone compound compound with a suitable cyanating agent to give a ω-halocyanocumylketone compound;
- (d) reacting the ω -halo-cyanocumylketone compound with an appropriate straight or branched C_1 - C_6 alcohol in the presence of a suitable anhydrous acid to give a ω '-halo- α '-keto- α , α -dimethylphenylacetic acid imidate compound;
- (e) reacting the ω'-halo-α'-keto-α,αdimethylphenylacetic acid imidate compound with water to give a ω'-halo-α'-keto-α,α-dimethylphenylacetic acid ester compound;
- (f) reacting the ω' -halo- α' -keto- α , α -dimethylphenylacetic acid ester compound with a piperidine compound of the formula

- wherein R₁, R₂ and m are as defined above in the presence of a suitable non-nucleophilic base to produce a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=O)-;
- (g) optionally hydrolyzing the ω'-piperidine- α'-ketoα,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=O)- to produce a ω'-piperidine- α'hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)-;
- (h) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=O)- or the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)-; and
- 35
- (i) optionally reacting the ω '-piperidine- α '-hydroxy- α , α -dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the appropriate ω '-piperidine- α '-keto- α , α -dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=O)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω '-piperidine- α '-hydroxy- α , α -dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -

CH(OH)- or a ω '-piperidine- α '-keto- α , α -dimethylphenyl derivative wherein R₃ is -COOalkyl and W is -C(=0)-; and

- 5 (j) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-lo dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,
- with the proviso that each of the hydroxy groups present in the compounds described in steps a-i are optionally protected or unprotected.
- 20 25. A process for preparing a compound of the formula

30

25

wherein

W represents -C(=0)- or -CH(OH)-;

R₁ represents hydrogen or hydroxy;

 R_2 represents hydrogen; or R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

m is an integer 0 or 1;

R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched;

each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R₁ and R₂ are taken together to form a second bond between the carbon atoms bearing R₁ and R₂ or where R₁ represented hydroxy, m is an integer 0, comprising the steps of:

- (a) reacting a ω -halo-halocumylketone compound with carbon dioxide under electrochemical reduction conditions to give a ω '-halo- α '-keto- α , α -dimethylphenylacetic compound;
- (b) reacting the ω'-halo-α'-keto-α,αdimethylphenylacetic compound compound with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,α-20 dimethylphenylacetic acid ester compound;
 - (c) reacting the ω '-halo- α '-keto- α , α -dimethylphenylacetic acid ester compound with a piperidine compound of the formula

25

15

30

wherein R_1 , R_2 and m are as defined above in the presence of a suitable non-nucleophilic base to produce a ω '-piperidine- α '-keto- α , α -dimethylphenyl derivative of formula (I) wherein R_3 is COOalkyl and W = -C(=0)-;

- (d) optionally hydrolyzing the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=O)- to produce a ω'-piperidine-α' 5 keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)-;
- (e) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is
 10 COOalkyl and W is -C(=0)- or the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=0)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-lipheridine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)-; and
- (f) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -20 COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl
 25 derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)-or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-; and
- 30 (g) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=O)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -

COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,

- 5 with the proviso that each of the hydroxy groups present in the compounds described in steps a-f are optionally protected or unprotected.
 - 26. A process for preparing a compound of the formula

10

15

20

wherein

W represents -C(=0)- or -CH(OH)-;

R1 represents hydrogen or hydroxy;

R2 represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer 3;

m is an integer 0 or 1;

R₃ is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R₁ and R₂ are taken together to form a second bond between the carbon atoms bearing R₁ and R₂ or where R₁ represented hydroxy, m is an integer 0, comprising the steps of:

10

(a) reacting a cumyl compound of the formula

wherein ${\bf A}$ is as defined above with an appropriate cyclopropyl compound of the structure

B 0

- wherein B is halo or hydroxy, in the presence of a suitable Lewis acid to produce a cyclopropyl cumylketone comound;
- (b) reacting the cyclopropyl cumylketone compound with
 a suitable halogenating agent to give a cyclopropyl
 halocumylketone compound;
- (c) reacting the cyclopropyl halocumylketone compound with carbon dioxide under electrochemical reduction conditions to give a cyclopropylketo-α,α-dimethylphenylacetic acid compound;
- (d) reacting the cyclopropylketo-α,αdimethylphenylacetic with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,αdimethylphenylacetic acid ester compound;
- (e) reacting the w'-halo-α'-keto-α,αdimethylphenylacetic acid ester compound with a piperidine compound of the formula

wherein R_1 , R_2 and m are as defined above in the presence of a suitable non-nucleophilic base to produce a w'-piperidineα'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W = -C(=0)-;

15

(f) optionally hydrolyzing the ω' -piperidine- α' -keto- α , α -dimethylphenyl derivative of formula (I) wherein R_3 is COOalkyl and W is -C(=0)- to produce a ω' -piperidine- α' keto- α , α -dimethylphenyl derivative of formula (I) wherein R_3 is COOH and W is -C(=0)-; 20

(g) optionally reacting the ω' -piperidine- α' -keto- α , α dimethylphenyl derivative of formula (I) wherein R3 is COOalkyl and W is -C(=0) or the w'-piperidine- α '-keto- α , α dimethylphenyl derivative of formula (I) wherein R_3 is COOH and W is -C(=0)- with a suitable reducing agent to produce a ω '-piperidine-a'-hydroxy-a,a-dimethylphenyl derivative of formula (I) wherein R_3 is -COOH and W is -CH(OH)- or the ω 'piperidine-a'-hydroxy-a,a-dimethylphenyl derivative of formula (I) wherein R_3 is -COOalkyl and W is -CH(OH)-; and

(h) optionally reacting the ω'-piperidine-α'-hydroxyα,α-dimethylphenyl derivative of formula (I) wherein R3 is -COOH and W is -CH(OH)- or the appropriate ω '-piperidine- α 'keto-a,a-dimethylphenyl derivative of formula (I) wherein R3 is -COOH and W is -C(=0)- with an appropriate straight or branched C1-C6 alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R_3 is -COOalkyl and W is

-CH(OH)-or a w'-piperidine- α '-keto- α , α -dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)-; and

5

(i) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=O)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is 10 COOalkyl and W is -C(=O)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,

with the proviso that each of the hydroxy groups present in the compounds described in steps a-h are optionally protected or unprotected.

20

27. A process for preparing a compound of the formula

25

30

wherein

W represents -C(=0)- or -CH(OH)-;

35 R₁ represents hydrogen or hydroxy;

R2 represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;
m is an integer 0 or 1;
R₃ is -COOH or -COOalkyl wherein the alkyl moiety has
from 1 to 6 carbon atoms and is straight or branched;
each of A is hydrogen or hydroxy; and
pharmaceutically acceptable salts and individual optical
isomers thereof, with the proviso that where R₁ and R₂
are taken together to form a second bond between the
carbon atoms bearing R₁ and R₂ or where R₁ represented
hydroxy, m is an integer 0, comprising the steps of:

(a) reacting a α,α -dimethylphenylacetic acid amide 15 compound of the formula

20

wherein A is as defined above and R₆ and R₇ are each independently H, C₁-C₆alkyl, C₁-C₆alkoxy or R₆ and R₇ taken together with the nitrogen atom for a pyrrolidine, piperidine or morpholine, with the proviso that R₆ and R₇ cannot both be represented by C₁-C₆alkoxy with a ω-halo compound of the formula

30

wherein B is halo or hydroxy, Hal represents Cl, Br or I and n is as defined above, in the presence of a suitable Lewis acid to produce a ω' -halo- α' -keto- α , α -dimethylphenylacetic acid amide compound;

35

(b) reacting the ω' -halo- α' -keto- α,α -dimethylphenylacetic acid amide compound with a piperidine compound of the formula

wherein R₁ and R₂ are as defined above in the presence of a suitable non-nucleophilic base to produce a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (XI) wherein R₅ is -CONR₆R₇ wherein R₆ and R₇ are as defined above;

- (c) optionally hydrolyzing the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (XI) wherein R₅ is -CONR₆R₇ wherein R₆ and R₇ are as defined above to produce a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)-;
- (d) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=0)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)-; and
- (e) optionally reacting the w'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=O)-with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)-; and

(f) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,

with the proviso that each of the hydroxy groups present in 15 the compounds described in steps a-e are optionally protected or unprotected.

28. A process for preparing a compound of the formula

20

25

30 wherein

W represents -C(=0)- or -CH(OH)-;

R₁ represents hydrogen or hydroxy;

R₂ represents hydrogen; or

R₁ and R₂ taken together form a second bond between the

carbon atoms bearing R₁ and R₂;

n is an integer of from 1 to 5;

m is an integer 0 or 1;

 R_3 is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0, comprising the steps of:

10

5

(a) reacting a toluene compound of the formula

wherein A is as defined above with a w-halo compound of the formula

20

wherein B is halo or hydroxy, Hal represents Cl, Br or I and
n is as defined above, in the presence of a suitable Lewis
acid to produce a w-halo-tolylketone compound;

- (b) reacting the ω-halo-tolylketone compound with a suitable base to give a cyclopropyl-tolylketone compound;
- (c) reacting the cyclopropyl-tolylketone compound with a suitable halogenating agent to give a cyclopropylhalotolylketone compound;
- (d) reacting the cyclopropyl-halotolylketone compound with a suitable cyanating agent to give a cyclopropyl cyanotolylketone compound;

(e) reacting the cyclopropyl cyanotolylketone compound with a suitable methylating agent to give a cyclopropyl cyanocumylketone compound;

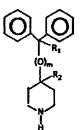

5

- (f) reacting the cyclopropyl cyanocumylketone compound with a suitable base to give a cyclopropylketo- α , α -dimethylphenylacetic acid amide;
- 10 (g) reacting the cyclopropylketo-α,αdimethylphenylacetic acid amide with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,αdimethylphenylacetic acid ester compound;

15

(h) reacting the ω '-halo- α '-keto- α , α -dimethylphenylacetic acid ester compound with a piperidine compound of the formula

20

25

wherein R_1 , R_2 and m are as defined above in the presence of a suitable non-nucleophilic base to produce a ω '-piperidine- α '-keto- α , α -dimethylphenyl derivative;

30

(i) optionally hydrolyzing the ω' -piperidine- α' -keto- α,α -dimethylphenyl derivative to produce a ω' -piperidine- α' -keto- α,α -dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)-;

35

(j) optionally reacting the ω' -piperidine- α' -keto- α,α -dimethylphenyl derivative of formula (I) wherein R_3 is COOH and W is -C(=O)- with a suitable reducing agent to produce a

 ω '-piperidine- α '-hydroxy- α , α -dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)-; and

- (k) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (II) wherein R₃ is -COOalkyl and W is -C(=0)-; and
- (1) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (II) wherein R₃ is -COOH and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α20 dimethylphenyl derivative of formula (II) wherein R₃ is -COOAlkyl and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl of formula (I) wherein R₃ is -COOAlkyl and W
 25 is -CH(OH)- with an appropriate deprotecting reagent,

with the proviso that each of the hydroxy groups present in the compounds described in steps a-k are optionally protected or unprotected.

30

WO 95/00480

29. A process for preparing a compound of the formula

5

10

wherein

W represents -C(=O)- or -CH(OH)-;

R₁ represents hydrogen or hydroxy;

R2 represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

m is an integer 0 or 1;

 R_3 is -COOH or -COOalkyl wherein the alkyl moiety has from 1 to 6 carbon atoms and is straight or branched; each of A is hydrogen or hydroxy; and

pharmaceutically acceptable salts and individual optical isomers thereof, with the proviso that where R_1 and R_2 are taken together to form a second bond between the carbon atoms bearing R_1 and R_2 or where R_1 represented hydroxy, m is an integer 0, comprising the steps of:

30

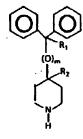

(a) reacting a phenylacetic acid ester compound of the formula

35

wherein ${\bf A}$ is as defined above with a $\omega-\text{halo}$ compound of the formula

wherein B is halo or hydroxy, Hal represents Cl, Br or I and n is as defined above, in the presence of a suitable Lewis acid to produce a ω '-halo- α '-keto-phenylacetic acid ester compound;

- (b) reacting the ω'-halo-α'-keto-phenylacetic acid ester compound with a suitable methylating agent in the presence of a suitable base to give a cyclopropylketo-α,αdimethylphenylacetic acid ester;
- (c) purifying the cyclopropylketo-a,a-dimethylphenylacetic acid ester by distillation and/or recrystallization;
 - (d) reacting the cyclopropylketo-α,αdimethylphenylacetic acid ester with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,αdimethylphenylacetic acid ester compound;
 - (e) reacting the ω'-halo-α'-keto-α,αdimethylphenylacetic acid ester compound with a piperidine compound of the formula

35

wherein R_1 , R_2 and m are as defined above in the presence of a suitable non-nucleophilic base to produce a ω' -piperidine- α' -keto- α , α -dimethylphenyl derivative of formula (I) wherein 5 R_3 is -COOalkyl and W is -C(=0)-;

- (f) optionally hydrolyzing the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)- to produce a ω'-piperidine-α' 10 keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)-;
- (g) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH 15 and W is -C(=O)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)-; and
- (h) optionally reacting the ω'-piperidine-α'-hydroxy-20 α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=O)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to 25 produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)-; and
- (i) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=O)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-

dimethylphenyl of formula (I) wherein R_3 is -COOalkyl and W is -CH(OH)- with an appropriate deprotecting reagent,

- 5 with the proviso that each of the hydroxy groups present in the compounds described in steps a-h are optionally protected or unprotected.

wherein

W represents -C(=0)- or -CH(QH)-;

R1 represents hydrogen or hydroxy;

R2 represents hydrogen; or

 R_1 and R_2 taken together form a second bond between the carbon atoms bearing R_1 and R_2 ;

n is an integer of from 1 to 5;

m is an integer 0 or 1;

R₃ is -COOH or -COOalkyl wherein the alkyl moiety has
from 1 to 6 carbon atoms and is straight or branched;
each of A is hydrogen or hydroxy; and
pharmaceutically acceptable salts and individual optical
isomers thereof, with the proviso that where R₁ and R₂
are taken together to form a second bond between the
carbon atoms bearing R₁ and R₂ or where R₁ represented
hydroxy, m is an integer 0, comprising the steps of:

(a) reacting a phenylacetic acid ester compound of the formula

5

wherein A is as defined above with a suitable methylating 10 agent to give a c.c-dimethylphenylacetic acid ester;

(b) reacting the $\alpha,\alpha\text{-dimethylphenylacetic}$ acid ester with a a $\omega\text{-halo}$ compound of the formula

15

35

wherein B is halo or hydroxy, Hal represents C1, Br or I and n is 3, in the presence of a suitable Lewis acid to produce a cyclopropylketo-a,a-dimethylphenylacetic acid ester;

- (c) purifying the cyclopropylketo-α,αdimethylphenylacetic acid ester by distillation and/or recrystallization;
- (d) reacting the cyclopropylketo-α,αdimethylphenylacetic acid ester with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable anhydrous acid to give a ω'-halo-α'-keto-α,αdimethylphenylacetic acid ester compound;
 - (e) reacting the ω' -halo- α' -keto- α,α -dimethylphenylacetic acid ester compound with a piperidine compound of the formula

5

wherein R₁, R₂ and m are as defined above in the presence of a suitable non-nucleophilic base to produce a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)-;

(f) optionally hydrolyzing the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is -C(=O)- to produce a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=O)-;

(g) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is COOH and W is -C(=0)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -CH(OH)-; and

(h) optionally reacting the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is - COOH and W is -CH(OH)- or the appropriate ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)- with an appropriate straight or branched C₁-C₆ alcohol in the presence of a suitable acid to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is - CH(OH)- or a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula (I) wherein R₃ is -COOalkyl and W is - C(=0)-; and

- (i) optionally reacting the ω '-piperidine- α '-keto- α , α -dimethylphenyl derivative of formula (I) wherein R₃ is -COOH and W is -C(=0)-, the ω '-piperidine- α '-keto- α , α -
- 5 dimethylphenyl derivative of formula (I) wherein R₃ is COOalkyl and W is -C(=O)-, the ω'-piperidine-α'-hydroxy-α,αdimethylphenyl derivative of formula (I) wherein R₃ is -COOH
 and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,αdimethylphenyl of formula (I) wherein R₃ is -COOalkyl and W
 10 is -CH(OH)- with an appropriate deprotecting reagent,

with the proviso that each of the hydroxy groups present in the compounds described in steps a-h are optionally protected or unprotected.

15

31. A process for preparing piperidine derivatives of formula

20

25

wherein

W represents -C(=0)- or -CH(OH)-;

R₃ is -COOH or -COOCH₃; and

pharmaceutically acceptable salts and individual

optical isomers thereof, comprising the steps of:

35 (a) reacting phenylacetic acid methyl ester with a suitable methylating ageant in the presence of a suitable base to give α, α -dimethylphenylacetic acid methyl ester:

(b) reacting α,α -dimethylphenylacetic acid methyl ester with a ω -halo compound of the formula

wherein B is halo or hydroxy and Hal represents Cl, Br or I in the presence of a suitable Lewis acid to produce a mixture of meta and para isomers of ω' -halo- α' -keto- α , α -dimethylphenylacetic acid methyl ester compounds of the formula

wherein Hal is defined above;

- (c) separating the para isomer of the ω'-halo-α'-ketoα,α-dimethylphenylacetic acid methyl ester compound by crystallization;
- (d) reacting the para isomer of the ω'-halo-α'-ketoα,α-dimethylphenylacetic acid methyl ester compound with a piperidine compound of the formula

30

in the presence of a suitable non-nucleophilic base to produce a ω '-piperidine- α '-keto- α , α -dimethylphenyl derivative of formula

5

10

wherein

W represents -C(=O);

R₃ is -COOCH₃; and pharmaceutically acceptable salts and individual optical isomers thereof;

(e) optionally hydrolyzing the ω'-piperidine-α'-keto-20 α,α-dimethylphenyl derivative wherein R₃ is COOCH₃ and W is -C(=0)- to produce a ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative of formula

25

30

wherein

W represents -C(=0)-;

R₃ is -COOH; and pharmaceutically acceptable salts and individual optical isomers thereof;

- (f) optionally reacting the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative wherein R₃ is COOCH₃ and W is -C(=0)- or the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative wherein R₃ is COOH and W is -C(=0)- with a suitable reducing agent to produce a ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative wherein R₃ is COOCH₃ and W is -10 CH(OH)-; and
- (g) optionally reacting the w'-piperidine-α'-keto-α,α-dimethylphenyl derivative wherein R₃ is -COOH and W is -C(=0)-, the ω'-piperidine-α'-keto-α,α-dimethylphenyl derivative wherein R₃ is -COOCH₃ and W is -C(=0)-, the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative wherein R₃ is -COOH and W is -CH(OH)- or the ω'-piperidine-α'-hydroxy-α,α-dimethylphenyl derivative wherein R₃ is -COOCH₃ and W is -CH(OH)- with an appropriate deprotecting reagent,
- with the proviso that the hydroxy groups present in the compounds described in steps a-f are optionally protected or unprotected.
- 32. A process according to claim 31 wherein the para isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound is further separated from the meta isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound by recrystallization of the para 30 isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound.
- 33. A process according to Claim 31 wherein additional para isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic 35 acid methyl ester compound is recovered from the mother liquors of the crystallization step (c), comprising the steps of:

(a) reacting the mixture of meta and para isomers of w'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compounds with a suitable base such as sodium methoxide to give a mixture of meta and para isomers of a cyclopropyl-α,α-dimethylphenylacetic acid methyl ester of the formula

10

- (b) enriching the para isomer of the cyclopropyl-α,α-dimethylphenylacetic acid methyl ester by removal of the
 15 meta isomer of the cyclopropyl-α,α-dimethylphenylacetic acid methyl ester by distillation; and
- (c) reacting the enriched para isomer of the cyclopropyl-α,α-dimethylphenylacetic acid methyl ester with 20 a suitable anhydrous acid to give the enriched para isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound.
- 34. A process according to Claim 33 wherein the
 25 enriched para isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound is further separated from the meta isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound by crystallization of the para isomer of the ω'-halo-α'-keto-30 α,α-dimethylphenylacetic acid methyl ester compound.
- 35. A process according to Claim 34 wherein the para isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound is further separated from the meta
 35 isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound by recrystallization of the para isomer of the ω'-halo-α'-keto-α,α-dimethylphenylacetic acid methyl ester compound.

I national application No.

PCT/US 94/05982

Box I	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This inte	rnational search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1	Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
2. [Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
	Claims searched incompletely: 7 - 10 ./.
3. 🔲	Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II	Observations where unity of invention is lacking (Continuation of item 2 of first sheet)
This Int	ernational Searching Authority found multiple inventions in this international application, as follows:
-	
_	
1. [_]	As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. [As all searchable claims could be searches without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.	As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
	en de la companya de Companya
4.	No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
	, issuado o de areas a ser a s
Remar	k on Protest The additional search fees were accompanied by the applicant's protest.
	No protest accompanied the payment of additional search fees.
	Company of Company (1) (1) (1) (1) (1) (1) (1) (1) (1) (1)

Form PCT/ISA/210 (continuation of first sheet (1)) (July 1992)

FURTHER INFORMATION CONTINUED FROM PCT/ISA/

Lack of conciseness

The definition of the following substituent(s) is too general and/or encompasses too broad a range of totally different chemical groups, only partly supported by examples given in the descriptive part of the application:

R5 , HAL
The number of theoretically conceivable compounds resulting from the combination of all claimed substituents of above list precludes a comprehensive search.
Guided by the spirit of the application and the inventive concept as disclosed in the descriptive part of the present application the search has been limited to the following case(s):
1-(.omega.-halo-substituted acyl)-4-X-subst. benzenes where X is:
Me/Et/i-Pr/2-propenyl-2/CH2-Hal,CN,Q-C=Q (Q is a hetero atom)/
CHMe-Hal,CN,Q-C=Q (Q is a hetero atom),CMe2-Hal,CN,Q-C=Q (Q is a hetero atom)

(Cf. Arts. 6, 15 and Rule 33 PCT, Guidelines Exam. Part B, Chapt. III, 3.6, 3.7)

Despite the above limitation(s) the search revealed too many relevant documents and/or compounds so that the search report shall not be considered complete.
